OPHTHALMIC DEVICES PANEL

108TH MEETING

Friday, March 5, 2004

9:00 a.m.

Gaithersburg Holiday Hotel
2 Montgomery Village Avenue
Gaithersburg, Maryland

P A R T I C I P A N T S

Jayne S. Weiss, M.D., Chairperson
Sara M. Thornton, Panel Executive Secretary

VOTING MEMBERS:

Arthur Bradley, Ph.D.
Michael R. Grimmett, M.D.
Allen C. Ho, M.D.
William D. Mathers, M.D.
Timothy T. McMahon, O.D.

INDUSTRY REPRESENTATIVE:

Ronald E. McCarley

CONSULTANTS:

Neil M. Bressler, M.D.
Jeremiah Brown, Jr., M.D.
Alexander J. Brucker, M.D.
Frederick J. Ferris, M.D.
Leo J. Maguire, M.D.
Janine A. Smith, M.D.
Walter J. Stark, M.D.

FDA PARTICIPANTS:

A. Ralph Rosenthal, M.D.
Malvina B. Eydelman, M.D.
Joseph N. Blustein, M.D.
Don Calogero, M.S.
Gene N. Hilmantel, O.D., M.D.

C O N T E N T S

	<u>PAGE</u>
Call to Order, Jayne W. Weiss, M.D.	4
Introductory Remarks and Introductions, Sara M. Thornton, Executive Secretary	4
Conflict of Interest Statement, Sara M. Thornton, Executive Secretary	7
Branch Updates, Karen F. Warburton, M.S., Vitreoretinal and Extraocular Devices Branch	9
FDA Presentation:	
Clear Lens Extraction for the Correction of Presbyopia:	
Malvina B. Eydelman, M.D., Division of Ophthalmic and Ear, Nose and Throat Devices	11
Joseph N. Blustein, M.D., M.P.H., Division of Ophthalmic and Ear Nose and Throat Devices	14
Malvina B. Eydelman, M.D., Division of Ophthalmic and Ear, Nose and Throat Devices	28
Open Public Hearing:	
Adrian Glasser, Ph.D., College of Optometry, University of Houston	42
Stephen Lane, M.D., University of Minnesota	51
Randall J. Olson, M.D., University of Utah (Letter Read by Ms. Thornton)	65
Panel Deliberations	68

P R O C E E D I N G S

Call to Order

DR. WEISS: I would like to call this meeting of the Ophthalmic Devices Panel to order, and we will have introductory remarks from Sarah Thornton, the Executive Secretary of the Panel.

MS. THORNTON: Good morning. On behalf of the FDA, I would like to welcome you to the 108th meeting of the Ophthalmic Devices Panel.

Before we proceed with today's agenda, I have a few short announcements to make. I would like to remind everyone to sign in on the attendance sheets in the registration area, just outside the meeting room. All public handouts for today's meeting are available at the registration table. Messages for panel members and FDA participants, information or special needs should be directed through Ms. Annemarie Williams who is available in the registration area. The phone number for calls to the meeting area is 301-977-8900.

In consideration of the panel, the sponsor and the agency, we ask that those of you with cell phones and pagers either turn them off or put them on vibration mode while in this room, and make your

1 calls outside the meeting area.

2 Lastly, will all meeting participants
3 please speak clearly into the microphone and give
4 your name so that the transcriber will have an
5 accurate recording of your comments?

6 At this time I would like to extend a
7 special welcome and introduce to the public, the
8 panel and the FDA staff two new panel consultants
9 who are with us at the table today for the first
10 time.

11 On my right, Dr. Neil Bressler, Professor
12 of Ophthalmology, with an international referral
13 practice in the Retinal Vascular Center at the
14 Wilmer Eye Institute of The Johns Hopkins
15 University School of Medicine; and Dr. Jeremiah
16 Brown, Jr., who is the director of Ophthalmology
17 Research at the Walter Reed Army Institute of
18 Research Laboratory at Brooks Air Force Base in San
19 Antonio, in addition to maintaining a private
20 retina practice with Ophthalmology Associates of
21 San Antonio. Welcome, gentlemen.

22 Will the remaining panel members please
23 introduce themselves, beginning with Rick McCarley?

24 MR. MCCARLEY: Good morning. My name is
25 Rick McCarley. I am President of Ophtec and I am

1 the industry representative.

2 DR. BRUCKER: Alexander Brucker,
3 Philadelphia, Pennsylvania, Professor of
4 Ophthalmology at the University of Pennsylvania
5 Scheie Eye Institute.

6 DR. FERRIS: Rick Ferris, I am the head of
7 the Division of Epidemiology and Clinical Research
8 at the National Eye Institute.

9 DR. BRADLEY: Arthur Bradley, Professor of
10 Vision Science, Indiana University.

11 DR. MCMAHON: Tim McMahon, Professor of
12 Ophthalmology, Department of Ophthalmology,
13 University of Illinois in Chicago.

14 DR. WEISS: Jayne Weiss, Professor of
15 Ophthalmology and Pathology, Kresge Eye Institute,
16 Wayne State University, Detroit.

17 DR. GRIMMETT: Michael Grimmett, Bascom
18 Palmer Eye Institute, University of Miami.

19 DR. MATHERS: Bill Mathers, Professor of
20 Ophthalmology at Oregon Health Sciences University.

21 DR. HO: Good morning. Allen Ho,
22 vitreoretinal surgeon, Wills Eye Hospital, Thomas
23 Jefferson University.

24 DR. SMITH: Janine Smith, Deputy Clinical
25 Director of the National Eye Institute.

1 DR. BRESSLER: Neil Bressler, already
2 introduced.

3 DR. BROWN: Jeremiah Brown.

4 DR. STARK: Walter Stark, Professor of
5 Ophthalmology, Wilmer Eye Institute, Baltimore,
6 Maryland.

7 DR. MAGUIRE: Leo Maguire, Associate
8 Professor, Mayo Clinic, Rochester, Minnesota.

9 DR. ROSENTHAL: Ralph Rosenthal, Division
10 Director, Ophthalmic and ENT Devices.

11 MS. THORNTON: Thank you. I would like to
12 note for the record that the panel consumer
13 representative, Ms. Glenda Such, will not be in
14 attendance today due to illness. Thank you, Jayne.

15 **Conflict of Interest Statement**

16 I would now like to read the conflict of
17 interest statement for today's meeting. The
18 following announcement addresses conflict of
19 interest issues associated with this meeting, and
20 is made part of the record to preclude even the
21 appearance of an impropriety.

22 To determine if any conflict existed, the
23 agency reviewed the submitted agenda for this
24 meeting and all financial interests reported by the
25 committee participants. The conflict of interest

1 statutes prohibit special government employees from
2 participating in matters that could affect their or
3 their employers' financial interests. However, the
4 agency has determined that participation of certain
5 members and consultants, the need for whose
6 services outweighs the potential conflict of
7 interest involved, is in the best interests of the
8 government.

9 Therefore, a waiver has been granted to
10 Dr. Alexander Brucker for his interest in a firm at
11 issue that could potentially be affected by the
12 panel's recommendations. The waiver allows him to
13 participate fully in today's deliberations. Copies
14 of this waiver may be obtained from the agency's
15 Freedom of Information Office, Room 12A-15 of the
16 Parklawn Building.

17 We would like to note for the record that
18 the agency took into consideration certain matters
19 regarding Drs. Alexander Brucker, Neil Bressler,
20 Frederick Ferris, Michael Grimmett, Allen Ho and
21 Jayne Weiss. They reported interests in firms at
22 issue but in matters not related to today's agenda.
23 The agency has determined, therefore, that they may
24 participate fully in all discussions.

25 In the event that the discussions involve

1 any other products or firms not already on the
2 agenda for which an FDA participant has a financial
3 interest, the participant should excuse himself or
4 herself from such involvement and the exclusion
5 will be noted for the record.

6 With respect to all other participants, we
7 ask in the interest of fairness that all persons
8 making statements or presentations disclose any
9 current or previous financial involvement with any
10 firm whose products they may wish to comment upon.
11 Thank you, Jayne.

12 DR. WEISS: Thank you. We are going to
13 now have branch updates, Karen Warburton.

14 **Branch Updates**

15 MS. WARBURTON: Good morning. I would
16 like to present one item of interest from our
17 Branch. One of the device types that the VEDB
18 reviews is the ophthalmic sponge, which is used
19 during LASIK surgery. We have recently become
20 aware of Medical Device Reports, or MDRs, that
21 identified an association between ophthalmic
22 sponges and diffuse lamellar keratitis. Testing of
23 a sample of ophthalmic sponges from a lot
24 associated with a cluster of DLK cases showed
25 significantly higher levels of bacterial endotoxin

1 than a different lot. Additional MDRs have also
2 reported an association between microkeratomes and
3 DLK, although most of those reports did not
4 implicate endotoxin per se.

5 Endotoxin has been shown to cause DLK in a
6 rabbit model and there have been reports in the
7 literature implicating endotoxin from sterilizer
8 water reservoirs as a cause of DLK outbreaks.
9 Additionally, a variety of other etiological
10 factors have been suggested. However,
11 endotoxin-contaminated ophthalmic sponges have not
12 previously been identified as a possible cause of
13 DLK. Endotoxin-contaminated water used during
14 device manufacture is a potential source.
15 Historically, FDA has not required that ophthalmic
16 sponges or other devices used in LASIK surgery be
17 pyrogen or endotoxin free, and they are typically
18 not labeled as such, although many may, in fact, be
19 endotoxin free.

20 Our Branch is working with other Center
21 offices to make the ophthalmic community aware of
22 this potential cause of DLK through letters to
23 professional organizations and letters to the
24 editor in journals which we anticipate will be
25 published in the near future. We hope to encourage

1 reporting of DLK to FDA through MDR reporting, and
2 to stimulate both user and FDA investigation into
3 these outbreaks so that we can better understand
4 the role that ophthalmic devices and endotoxin in
5 particular play in DLK, and make changes in our
6 product review policies if necessary. That
7 concludes my update. Are there any questions?

8 DR. WEISS: Seeing no questions, thank you
9 very much, Karen. We will now begin the open
10 committee session with the general issues
11 discussion and the FDA team presentation. Dr.
12 Eydelman?

13 **FDA Team Presentation**

14 DR. EYDELMAN: Good morning.

15 [Slide]

16 Today's discussion is centered around
17 clear lens extraction for the correction of
18 presbyopia. I want to thank Dr. Blustein, Don
19 Calogero and Gene Hilmantel for organizing today's
20 presentation and preparing all the materials.

21 [Slide]

22 Clear lens extraction--or CLE as we will
23 be referring to it for the rest of the day--for the
24 correction of presbyopia is an intraocular surgical
25 procedure where non-cataractous lens is removed and

1 replaced with a multifocal intraocular lens,
2 allowing for both distance and near vision. The
3 sole purpose of this procedure is for refractive
4 correction.

5 [Slide]

6 There are several points I wanted to make
7 sure panel members are clear on. CLE is not
8 currently approved in U.S. for any indication. It
9 has been performed, as all of you know, as an
10 off-label practice for several years but mainly in
11 eyes with high refractive errors.

12 [Slide]

13 There are currently no standards or
14 guidances available for clear lens extraction with
15 IOL implantation.

16 [Slide]

17 There is currently only one multifocal IOL
18 approved in U.S., but there are quite a few under
19 investigation. Only two IOLs are approved for
20 improving near vision acuity in presbyopic
21 patients, and that is the AMO Array and the CMC
22 Vision. Several different devices utilizing quite
23 various approaches are under investigation. Again,
24 there are no standards or guidances for devices
25 solely intended for the correction of presbyopia.

1 [Slide]

2 An estimated 1.5 billion people worldwide
3 have presbyopia. Therefore, devices approved for
4 the correction of presbyopia will have a very
5 significant public health impact.

6 [Slide]

7 The challenge that faces us today is in
8 trying to design a study which will be least
9 burdensome for establishing safety and efficacy of
10 the device for the correction of presbyopia while
11 making sure that the significance to public health
12 impact due to improper trial design is considered.

13 [Slide]

14 We want to make sure that we address all
15 the appropriate aspects of the appropriate study
16 design. So, today we will ask for your
17 consideration on the control population;
18 inclusion/exclusion criteria; acceptable adverse
19 event rates; sample size; study duration; variables
20 to be investigated; efficacy endpoints and quality
21 of life assessment.

22 [Slide]

23 The goal, of course, is designing an
24 appropriate clinical trial for evaluation of clear
25 lens extraction for the correction of presbyopia.

1 The first step in pursuing that goal was
2 identification of all relevant adverse events and
3 their anticipated time course. In order to address
4 that, we did quite an extensive literature search
5 which Dr. Blustein will summarize for you.

6 [Slide]

7 DR. BLUSTEIN: Initially we looked for
8 studies that related specifically to clear lens
9 extraction for presbyopia. There were very few
10 articles that addressed this topic. There were two
11 that we found, Dick and associates and Packer and
12 associates, that dealt with clear lens extraction
13 for presbyopia. Both studies were using the Array
14 multifocal IOL.

15 [Slide]

16 Dick and associates--their study was a
17 prospective study with 25 patients. They were
18 bilateral CLE with MIOL. The average patient age
19 was 51, with a range of 44-62. The preop spherical
20 equivalent ranged from minus 25.5 to plus 5.75
21 diopters. Follow-up was at 6 months and the
22 outcomes for efficacy were very good, 100 percent
23 binocular uncorrected visual acuity of 20/30 and J4
24 or better. However, 48 percent of the patients
25 complained of star bursts and 36 percent complained

1 of halos.

2 [Slide]

3 Packer and associates, in a retrospective
4 study of 68 eyes and 36 patients--their study was
5 not limited to just clear lens extraction but 34
6 percent of the eyes had received additional
7 procedures for astigmatism. The average age was 58
8 years old and the range was from 45-81. Preop
9 spherical equivalent ranged from minus 7.5 to plus
10 6.5 diopters. Follow-up was at 3 and 6 months.
11 The outcomes--again, there was good efficacy with
12 94 percent binocular uncorrected visual acuity of
13 20/40 and J5 or better. Close to 6 percent had
14 symptomatic posterior capsular opacities requiring
15 YAG capsulotomies. There were no complication
16 rates and there were no reports or assessment of
17 visual symptoms.

18 [Slide]

19 Clear lens extraction with monofocal
20 IOLs--because there was limited information for the
21 multifocals we looked at what was done with
22 correcting other refractive procedures with clear
23 lens extraction so we looked at three areas for
24 ametropia, hyperopia and myopia.

25 [Slide]

1 Vicary and associates, in a retrospective
2 study of 138 cases with average patient age of
3 close to 49 years of age, ranging from 22-69 years
4 of age, with a range of preop spherical equivalent
5 of minus 23.75 to plus 11.62 diopters, with an
6 average follow-up time of 5 months, with a range of
7 2-26 months, reported on the following outcomes:
8 They had uncorrected visual acuity at 3 months with
9 90 percent at 20/40 or better and close to 50
10 percent had 20/20 or better. Retinal detachment at
11 5 months, there was one case so that gave a rate of
12 0.7 percent. Uveitis, again one case with the same
13 rate. Posterior capsular opacification requiring
14 YAG capsulotomies was at 8 percent. Additional
15 refractive surgeries were performed in 7 cases.

16 [Slide]

17 For clear lens extraction for hyperopia
18 there were several studies that were performed in
19 U.S., England, Belgium, India and Greece. They
20 overall reported good efficacy in these studies.
21 The sample sizes were relatively small, ranging
22 from 18 to 50 eyes. Patient age ranges were from
23 19-86, and this is across all these studies. The
24 preop spherical equivalent ranged from plus 2.75 to
25 plus 13 diopters. The follow-up was anywhere from

1 1-60 months in these patients.

2 [Slide]

3 The complications reported for the clear
4 lens extraction for hyperopia collectively in these
5 studies were that for posterior capsular
6 opacification requiring YAG capsulotomy ranged from
7 5.6 percent to 54 percent in these studies.
8 Posterior capsular tears at the time of surgery
9 ranged from close to 3 percent to a little over 5
10 percent. Two cases required IOL exchange. Then,
11 there were single case events reported of iris
12 prolapse, iridodialysis, corneal burn and malignant
13 glaucoma. The malignant glaucoma case occurred two
14 years after implantation. Endothelial cell loss
15 was reported for one study after 12 months at 7.38
16 percent.

17 [Slide]

18 Then we looked at clear lens extraction
19 for high myopia. There are several reported
20 studies with high efficacy. The problems with
21 these studies is that there are short follow-up
22 times that are associated with them and also
23 exclusion of lost to follow-up on patients.

24 [Slide]

25 Colin and associates had a 7-year

1 follow-up of their study of clear lens extraction
2 for high myopia. There were 52 eyes in 30
3 patients. Preop spherical equivalent average was
4 minus 16.9 diopters and the axial length in 64
5 percent was greater than 29 mm. Average patient
6 age was 36, a little over 36 years of age, with a
7 range of 22-51 years of age. They had performed
8 laser pre-treatments on anyone who had suspicious
9 lesions for future retinal detachments, treating
10 lattice, retinal tears and retinal holes. The
11 results of this study showed that close to 60
12 percent were within 1 diopter of emmetropia and
13 approximately 85 percent were within 2 diopters of
14 emmetropia.

15 [Slide]

16 Colin and associates reported the retinal
17 detachment rate at 4 years and then again at 7
18 years. At 4 years it was 2 percent and at 7 years
19 it was 8.1 percent. This points out the importance
20 that retinal detachments can occur later in the
21 postop period.

22 [Slide]

23 In this study 75 percent of the retinal
24 detachment had YAG capsulotomies prior to the
25 retinal detachments. One eye had YAG one year

1 before the retinal detachment and two eyes had YAG
2 two years before the retinal detachment. In the
3 four eyes that had retinal detachments the best
4 corrective visual acuity ranged from 20/30 to
5 20/200 and the visual acuity in the fellow eye
6 ranged from 20/30 to 20/100 in the untreated eye.

7 [Slide]

8 The slide on the right shows the posterior
9 opacification with YAG capsulotomies. At 4 years
10 it was approximately 37 percent and 61 percent
11 after 7 years. So, again, this is to illustrate
12 that complications of posterior opacification can
13 occur beyond the follow-up time, short follow-up
14 time. So, after 7 years there was a significant
15 number that also had complications of
16 opacification.

17 [Slide]

18 The mean time to YAG in this study was a
19 little bit over 48 months, ranging from 9-75
20 months. Close to 37 percent within 4 years of
21 clear lens extraction had significant posterior
22 capsular opacification and 61 percent within the 7
23 years. The odds ratio of retinal detachment after
24 clear lens extraction and YAG versus no YAG was
25 2.0. Other complications that were reported in

1 Colin's study were subfoveal choroidal
2 neovascularization in one eye which occurred 9
3 months after surgery, and there was a decrease in
4 best corrected visual acuity in that eye from 20/50
5 to 20/200.

6 [Slide]

7 Ripandelli and associates were reporting
8 from the refractive surgeons studies. They were
9 reporting from the retinal surgeons perspective.
10 They reported on retinal detachment secondary to
11 clear lens extraction for high myopia. they saw 53
12 eyes in their practice. The preop spherical
13 equivalent average was minus 19.5 diopters, ranging
14 from minus 14 to minus 29. Patient age was an
15 average of 37.5, ranging from 25-58 years of age.
16 This is in Italy, this practice. Laser pre-clear
17 lens extraction was performed in close to 58
18 percent of these eyes. The time after clear lens
19 extraction to the retinal detachment average was
20 2.25 years and ranged anywhere from 1 month to 4
21 years. YAG capsulotomies had been performed in a
22 little bit over 25 percent of these patients.
23 Then, macular involvement was in 100 percent of the
24 eyes that had been operated on.

25 [Slide]

1 Twelve eyes were lost to follow-up because
2 they didn't come back for surgery even though that
3 was recommended. For retinal detachment repair, 88
4 percent had the retina reattached; 41.5 percent had
5 proliferative vitreoretinopathy; 34 percent had
6 posterior retinal breaks. The results are that 22
7 percent had best corrected visual acuity of 20/60
8 or better. One patient had hand motion in one eye
9 and 20/100 in the other. The pre-clear lens
10 extraction visual acuity in this patient was 20/20
11 and 20/25.

12 [Slide]

13 O'Brien and associates reported that for
14 clear lens extraction for high myopia the efficacy
15 is certainly encouraging, that this seems to be
16 very beneficial in terms of correcting the
17 refractive error. However, the potential
18 complications still outweigh the risks.

19 [Slide]

20 Literature review for clear lens
21 extraction--there was only one study with long-term
22 follow-up. That was the Colin study that followed
23 for 7 years. The rates of retinal detachment
24 continue to increase postop, 2 percent at 4 years
25 and then 8 percent at 7 years. Lack of long-term

1 retinal detachment rates post clear lens extraction
2 is a concern. So, we did a little literature
3 search on retinal detachment rates post cataract
4 extraction.

5 [Slide]

6 About 40 percent of all retinal
7 detachments occur post cataract extraction.
8 Patient-dependent risk factors include age, gender,
9 refractive state, fellow eye, status of the
10 posterior vitreous. Those are patient-dependent
11 risk factors.

12 [Slide]

13 Surgeon-dependent risk factors include
14 surgical technique, whether it is intracapsular or
15 extracapsular, phacoemulsification and also
16 incision size, capsulotomy and maintaining anterior
17 chamber depth. Intraoperative complications are
18 also risk factors--torn posterior capsule or
19 vitreous loss.

20 [Slide]

21 Then, postoperative risk factors include
22 trauma and YAG capsulotomy.

23 [Slide]

24 Norregaard and associates had a
25 population-based Danish study which looked at all

1 cataract inpatient surgeries done from 1985 to 1987
2 with 4-6 years follow-up and patient age of 50 or
3 over. They used a reference group of a cohort that
4 was age matched, gender matched and had no previous
5 intraocular surgery.

6 [Slide]

7 The 4-year retinal detachment risk after
8 cataract surgery for various surgical techniques
9 was shown to be 3.2 percent for extracapsular
10 without IOL; 2.8 percent for intracapsular cataract
11 extraction without IOL; and 0.93 percent for
12 extracapsular without IOL. The reference group had
13 retinal detachment rate of 0.21 percent.

14 [Slide]

15 The 4-year retinal detachment risk after
16 extracapsular cataract extraction with IOL was
17 stratified by age. There were increasing rates
18 with decreasing age, 2.43 percent for the age group
19 of 50-59 years of age; 60-69 years of age, 1.51
20 percent; 0.82 percent for 70-79 years of age; and
21 80 and above was 0.47.

22 [Slide]

23 This relative risk for retinal detachment
24 stratified by age, with the reference group having
25 no intraocular surgery, shows that there is a

1 significant relative risk in the younger age
2 groups. In the 50-59 group, they are over 20 times
3 more likely to have a retinal detachment having had
4 surgery; for 60-69 they are 12.5 times more likely
5 to have retinal detachment; 70-79, close to 7 times
6 more likely; and even 80 and older still, close to
7 4 times more likely to have retinal detachment when
8 no surgery was performed.

9 [Slide]

10 Javitt and associates, did a U.S.
11 population-based study looking at all Medicare
12 beneficiaries having cataract extraction in the
13 year 1984, with a sample size of over 300,000 and
14 they excluded the younger age Medicare
15 beneficiaries and only included the 66 and older
16 group. Extracapsular extraction was done in 60
17 percent of these patients; intracapsular was done
18 in 31 percent; and phacoemulsification in 9
19 percent. They followed this in the database for
20 rehospitalization for retinal detachments over 4
21 years.

22 [Slide]

23 In their study, they showed that the risk
24 factors were dependent on race, with whites being
25 1.7 times more likely to have a retinal detachment

1 than Blacks and with the various surgical
2 techniques the intracapsular having the greatest risk
3 and phacoemulsification the lowest. The younger
4 age is also at greater risk for retinal detachments
5 compared to the older, and we will go into that a
6 little bit more.

7 [Slide]

8 For 4-year retinal detachment risk after
9 cataract surgery stratified by age, they found 2.2
10 percent for 65-69 years of age patients; 1.3
11 percent for 70-79 year-old patients; 0.6 percent
12 for 80-89; and 0.2 percent for 90 and above.

13 [Slide]

14 When you look at the relative risk, the
15 65-69 year age group were 18 times more likely to
16 have retinal detachment than the no surgery group;
17 70-79 years old, close to 11 times more likely to
18 have retinal detachment; 80-89, 5 times more
19 likely; and 90 or above, 1.67 times more likely to
20 have retinal detachment.

21 [Slide]

22 Javitt did another study. This was based
23 on a 5 percent sample of Medicare beneficiaries.
24 They looked at inpatient and outpatient surgeries
25 between 1986 and 1987. The sample size was over

1 57,000, and they looked at 3-year follow-up for
2 retinal detachment.

3 [Slide]

4 The cumulative 3-year retinal detachment
5 rate was 0.81 percent, which was a rate similar to
6 the previous inpatient study. Also, they showed
7 that younger patients were more at risk than older
8 patients.

9 [Slide]

10 This is from the 3-year retinal detachment
11 risk after extracapsular cataract extraction,
12 showing 0.95 percent for the 65-69 year-old group;
13 0.51 percent for the 70-79 year-olds; 0.24 percent
14 for the 80-89 year-olds; and 0.08 percent for the
15 90 and above.

16 [Slide]

17 Looking at the slide on your right,
18 summarizing the Danish study and the earlier Javitt
19 study, they found one-year rates for retinal
20 detachment with extracapsular with IOL and for the
21 Danish study it was 0.42 percent and the 4-year
22 rate was 3.2 percent for extracapsular without IOL
23 and then 0.93 percent for extracapsular with IOL.

24 In the Javitt study the one-year rate for
25 combining extracapsular cataract extraction whether

1 it was with or without IOL was 0.3 percent and for
2 phacoemulsification it was 0.4 percent. The 4-year
3 rate was 0.9 percent for extracapsular cataract
4 extraction and 1.17 percent for
5 phacoemulsification.

6 [Slide]

7 The relative risk for retinal detachment
8 at one year in the Danish study, extracapsular
9 cataract extraction with IOL was 14 times more
10 likely to have retinal detachment than no surgery.
11 At 4 years, extracapsular cataract extraction with
12 IOL was 26.67 times more likely to have retinal
13 detachment than no surgery; and extracapsular
14 cataract extraction with IOL was 7.75 times more
15 likely.

16 In the U.S. study at one year
17 extracapsular cataract extraction was 10 times to
18 have a retinal detachment, and with
19 phacoemulsification it was 13.3 times more likely
20 to have a retinal detachment. At 4 years the
21 relative risk for retinal detachment with
22 extracapsular cataract extraction was 7.5 times and
23 for phacoemulsification was 9.75 times.

24 [Slide]

25 Rowe and associates reported on cumulative

1 retinal detachment rates after extracapsular
2 cataract extraction and phacoemulsification. It
3 was a population-based study in Olmstead County,
4 Minnesota. It was an incidence study. They looked
5 at retinal detachment diagnosed between 1976 and
6 1995. The retinal detachment rates were adjusted
7 for age and gender and they were compared with
8 non-surgical retinal detachment rates.

9 [Slide]

10 The cumulative retinal detachment rates
11 after extracapsular cataract extraction and
12 phacoemulsification at 2 years was 0.36 percent
13 compared to 0.034 percent with no surgery. At 5
14 years it was 0.77 percent compared to 0.13 percent
15 with no surgery. At 10 years it was 1.29 percent
16 compared to 0.25 percent with no surgery.

17 [Slide]

18 Looking at this as relative risk, at 2
19 years it is 10.59 times more likely to have a
20 retinal detachment with cataract surgery; at 5
21 years it was 5.92 times more likely; and at 10
22 years it was 5.16.

23 [Slide]

24 DR. EYDELMAN: In light of the literature
25 summary that you just heard, the first question we

1 would like you to consider is do you recommend a
2 control population for studies of clear lens
3 extraction for the correction of presbyopia, or do
4 you believe that the study subject's own
5 preoperative data is sufficient for comparison?

6 [Slide]

7 If you do recommend a control population,
8 which one of the following do you believe to be
9 appropriate? Is it historical control, active
10 control or some other control? Active control
11 would imply concurrent enrollment in a study of
12 subjects with no previous ocular surgery. For
13 historical control that you would obtain from the
14 literature, there are several options, subjects'
15 status post CLE for correction of presbyopia or
16 those that have had a composite of all different
17 refractive indications; subjects' status post
18 cataract extraction or those that had no previous
19 ocular surgery. Those are, obviously, all choices
20 we would like you to consider.

21 [Slide]

22 Any time we define an appropriate study
23 population for the investigation the real issue is
24 identifying patients for whom risk/benefit
25 assessment warrants enrollment in such a study.

1 [Slide]

2 Therefore, the question we ask you is
3 should the clinical study inclusion/exclusion
4 criteria limit subject enrollment based on the
5 criteria listed below? If yes, we would like you
6 to discuss the appropriate ranges of each limiting
7 criteria for inclusion in the study.

8 [Slide]

9 Under (a) is refractive error and axial
10 length, and we would like you to consider each one,
11 the hyperopia and its associated refractive range;
12 emmetropia; myopia with its range; (b) subject's
13 age.

14 [Slide]

15 (c) Degree of accommodative loss, and in
16 that discussion we would like you to consider based
17 on what measurement you are making your
18 recommendations; (d) preoperative endothelial cell
19 count; and (e) any other factors, such as BCVA.

20 [Slide]

21 As you heard from Dr. Blustein, there are
22 several numbers that are reported in the literature
23 but all the literature essentially concurs that
24 subjects with no surgery have much less chance than
25 those that do undergo a lens extraction.

1 [Slide]

2 With that in mind, we would like you to
3 consider what should be the primary safety endpoint
4 for the study?

5 [Slide]

6 Another consensus from the literature is
7 that the younger subjects do, indeed, have higher
8 cumulative RD rates and that is basically due to
9 the vitreoretinal interface characteristics and the
10 fact that the risk continues to increase over time
11 and these subjects have essentially a greater
12 number of years left to life after the lens
13 extraction.

14 [Slide]

15 So, is retinal detachment primary safety
16 endpoint?

17 [Slide]

18 After clear lens extraction with MIOL
19 subjects might experience visual symptoms requiring
20 IOL exchange. Therefore, endothelial cell
21 densities should be adequate to withstand
22 additional surgery. From the literature review you
23 have heard only one number, 7.38 percent
24 endothelial cell loss at 12 months after CLE.
25 However, these losses are really consistent with

1 operative losses themselves.

2 [Slide]

3 Several years ago Don Calogero, myself and
4 Dr. Aresnoff, from Toronto, performed a
5 meta-analysis of a literature review to try to
6 determine what is the operative endothelial cell
7 loss secondary to cataract surgery. There we
8 determined that 8.9 percent endothelial cell loss
9 is seen secondary to extracap and 7.4 secondary to
10 phaco. These are losses that were secondary to
11 operative loss itself, i.e., the range was 2-6
12 months.

13 [Slide]

14 There is no long-term data on endothelial
15 cell loss after clear lens extraction.
16 Furthermore, there is very limited data on
17 long-term loss after cataract surgery. We all know
18 from the last several panel meetings that Bourne
19 et. al. reported 0.6 percent CLE loss for eyes
20 without any surgery. However, I don't think all of
21 you might be aware of the fact that Bourne has also
22 performed a study showing that after cataract
23 surgery itself there is a 2.5 percent cell loss
24 that continues annually. Now, this was at 10-year
25 follow-up of a rather small cohort, 64 eyes, and

1 surgeries were performed from '76 to '82, both
2 extracap and intracap, and some of the subjects
3 were left aphakic. So, the accuracy of that number
4 with respect to modern surgery is questionable, but
5 the fact that there is continuous loss secondary to
6 cataract extraction itself seems to be implicit.

7 [Slide]

8 In light of that, is endothelial cell loss
9 perhaps a primary safety endpoint, or if not a
10 primary, should it be a safety endpoint?

11 [Slide]

12 Once you discuss what should be the
13 primary safety endpoint, we would like you to
14 concentrate on the acceptable adverse event rate
15 associated with this safety endpoint.

16 [Slide]

17 The next question that we would like you
18 to consider is sample size and follow-up
19 appropriate for clear lens extraction studies. Not
20 to give you a blank screen, we did several sample
21 size assessments so you have something to work
22 with.

23 The slide on the left summarizes
24 statistics that we ran for the sample sizes that
25 would be required for maximum allowable RD rate per

1 year. Here we assume a historical control rate of
2 0.01 percent annual RD. So, in the first column we
3 have different study duration options, 1 year, 2
4 years, 3 years. Just to give you an example, if we
5 assume that the maximum allowable RD rate per year
6 should be 0.3 percent, a study design would require
7 321 subjects. That is how this table reads. If
8 you have any questions later I can describe it
9 further.

10 [Slide]

11 We also ran sample size statistics for
12 endothelial cell loss. There are two tables, this
13 and the next slide. This one is assuming a fixed
14 historical rate of 0.6 percent annual cell loss.
15 Again, in the first column you have one, two or 3
16 year study duration. Across, 1,000, 1,200, 1,400
17 and 1,500 are some of the cell densities that we
18 assumed for you to choose from as the minimum cell
19 density that you would like subjects to have at age
20 75. As a reference, down below, in the yellow, I
21 put down that the normal ECD at age 75 is 2,400
22 with a standard deviation of 500. So, once again
23 just to try to explain to you how this table works,
24 if you say that you would like for a subject at age
25 75, after having clear lens extraction performed

1 somewhere in their 40s, to end up with 1,200 cells,
2 for a one-year study that would require 319
3 subjects and for a three-year study only 26
4 subjects.

5 [Slide]

6 As I showed you before, this is the same
7 table but now assuming active control, i.e., you
8 would enroll patients who are not operated and you
9 measure their cell loss. With the same examples,
10 one year for 1,200 would be 638 and for three years
11 it would be 48.

12 [Slide]

13 So, the question is in order to adequately
14 determine the rates of all the adverse events and
15 complications of concern, what do you feel is the
16 appropriate sample size and follow-up period for a
17 CLE study for the correction of presbyopia prior to
18 the submission of the PMA?

19 [Slide]

20 I stress "prior" because the next question
21 deals with post-market studies. To clarify, the
22 post-market process can detect, identify and
23 describe new or previously undetected medical
24 device hazards. It also has the advantage of using
25 real-world medical device experience to confirm the

1 safety profile of the device that was established
2 in the pre-market submission and it could be a
3 condition of approval.

4 [Slide]

5 In light of that, do you believe a
6 post-market study is indicated? If so, what is the
7 appropriate type of study, sample size and length
8 of follow-up for such a study?

9 [Slide]

10 Acceptable adverse event rates for
11 posterior chamber IOLs at one year following
12 cataract extraction are in the FDA grid. The
13 updated FDA adverse event rates are listed for you
14 on the left, and I will spare you going through
15 them. Are these rates applicable for correction of
16 presbyopia in non-cataractous eyes for CLE at one
17 year postop? Again, we are comparing one year to
18 one year but adverse events that were historically
19 acceptable after cataract surgery now to eyes which
20 have not had cataracts.

21 [Slide]

22 Should the acceptable adverse event rates
23 be adjusted for the study duration recommended? If
24 yes, how? Furthermore, do additional adverse
25 events need to be collected? If so, what should be

1 their acceptable rates?

2 [Slide]

3 FDA believes that all multifocal IOLs'
4 safety and efficacy profiles will have to be
5 established in a cataractous population prior to
6 initiation of a clinical trial in a non-cataractous
7 population. MIOL performance in a cataractous
8 population will, therefore, be known for all tests
9 and sub-studies outlined in ANSI draft standards
10 for MIOLs.

11 [Slide]

12 On the slide on the left I summarized for
13 you in the first column all the measurements that
14 are recommended to be performed on all study
15 populations. In the column on the right are those
16 that are done in sub-studies. Just to clarify, it
17 is best spectacle corrected visual acuity at
18 distance; near visual acuity with distance
19 correction; uncorrected visual acuity at distance;
20 uncorrected visual acuity at near; pupil size; lens
21 stability; and subject survey. The sub-studies are
22 defocus curves; fundus visualization; far contrast
23 sensitivity; and functional performance.

24 [Slide]

25 Which sub-studies do you recommend for

1 inclusion in the clear lens extraction protocol for
2 evaluation of performance in this non-cataractous
3 population? A) is functional performance and the
4 functional performance study determines deficits in
5 functional vision secondary to optical effects or
6 multifocal IOLs. An example is a driving
7 simulation study which was performed for MIOs.

8 B) is contrast sensitivity and the current
9 recommendation is for grading contrast sensitivity
10 tests to assess threshold for spatial gradings.

11 C) is defocus curves and defocus
12 evaluation comparing clinical performance to the
13 theoretical lens design. What is done is that a
14 subject's best spectacle corrected visual acuity at
15 distance is obtained for the subject, and then the
16 subject is defocused in 0.5 diopter steps to minus
17 5 diopters.

18 D) is fundus visualization and the current
19 recommendation is for the investigators to rate the
20 clarity of the retinal image through multifocal
21 versus monofocal IOLs.

22 Then there is the endothelial cell
23 evaluation and I think you all know about that by
24 now, and any others that you might recommend.

25 [Slide]

1 The only current performance efficacy
2 endpoint for aphakic posterior chamber IOLs, from
3 the FDA grid once again, is post-operative BCVA of
4 20/40 or better in 92.5 percent of the subjects.
5 Is this applicable to non-cataractous eyes
6 undergoing CLE for the correction of presbyopia?

7 [Slide]

8 Question 7 B), are the predictability--75
9 percent of eyes with MRSE plus/minus 1 diopter and
10 50 percent with MRSE plus/minus 0.5 diopter and
11 UCVA endpoint of 85 percent with 20/40 or better,
12 outlined in FDA's draft guidance for refractive
13 implants, applicable for this scenario?

14 [Slide]

15 Do we need to establish a performance
16 efficacy endpoint for UCVA at near in this
17 population of subjects who are undergoing surgery
18 for the correction of presbyopia? If yes, what do
19 you recommend?

20 [Slide]

21 What additional performance efficacy
22 endpoints, if any, need to be set?

23 [Slide]

24 Something that you all need to consider is
25 whether a general population of presbyopes without

1 cataracts will be tolerant of potential optical
2 aberrations associated with MIOLs.

3 [Slide]

4 How do you recommend that we evaluate
5 patient's quality of life issues?

6 [Slide]

7 There are several questionnaires which are
8 validated and recommended in our ANSI standards,
9 Javitt, Vitale, Schein and NEI refractive. If you
10 can make a specific recommendation about the
11 applicability of these questionnaires or
12 combination of them, we would greatly appreciate
13 it. This concludes our presentation.

14 DR. WEISS: Dr. Eydelman and Dr. Blustein,
15 your presentation was absolutely superb and I hope
16 the clarity of your questions can be met by the
17 panel's answer to your questions.

18 DR. EYDELMAN: Thank you.

19 DR. WEISS: Thank you very much. We are
20 now going to open the open public hearing session.
21 Before we do, there is a statement that the FDA
22 requires me to read. Both the Food and Drug
23 Administration and the public believe in a
24 transparent process for information gathering and
25 decision-making. To ensure such transparency at

1 the open public hearing session of the advisory
2 committee meeting, FDA believes that it is
3 important to understand the context of an
4 individual's presentation. For this reason, FDA
5 encourages you, the open public hearing speaker, at
6 the beginning of your written or oral statement to
7 advise the committee of any financial relationship
8 that you may have with a sponsor its product and,
9 if known, its direct competitors. For example,
10 this financial information may include the
11 sponsor's payment of your travel, lodging or other
12 expenses in connection with your attendance at the
13 meeting. Likewise, FDA encourages you at the
14 beginning of your statement to advise the committee
15 if you do not have such financial relationships.
16 If you choose not to address this issue of
17 financial relationships at the beginning of your
18 statement it will not preclude you from speaking.

19 We have two speakers today. I will ask
20 Dr. Adrian Glasser, Associate Professor at the
21 College of Optometry, University of Houston, to
22 come forward for his presentation. I will inform
23 members of the panel that there will be an
24 opportunity to ask questions, both to the FDA team
25 as well as the open public hearing presenters, at

1 the beginning of the panel deliberations.

2 **Open Public Hearing**

3 DR. GLASSER: Thank you. I would just
4 like to start by saying thank you very much for the
5 opportunity to present.

6 [Slide]

7 I am going to be talking on the topic of
8 pseudophakic accommodation measurements. As
9 mentioned, my name is Adrian Glasser. I am an
10 Associate Professor at the College of Optometry at
11 the University of Houston.

12 [Slide]

13 I am a scientist with research interest in
14 accommodation and presbyopia. I have research
15 funding and I serve as a consultant to several
16 companies with interests in accommodation
17 restoration concepts. I am here in my capacity as
18 an interested scientist and as a consultant to
19 industry.

20 My attendance at this meeting has been
21 sponsored by a company with interest in
22 accommodation restoration concepts. I am not
23 talking about any specific devices so I have no
24 proprietary interests in anything I will be
25 presenting in this talk.

1 [Slide]

2 The purpose of my presentation is to
3 attempt to open a healthy, constructive and
4 informed dialogue between the FDA, researchers,
5 clinicians and companies with interests in
6 accommodation restoration concepts on the issues
7 and challenges of pseudophakic accommodation
8 measurement.

9 [Slide]

10 The presentation that I will make is
11 primarily directed at accommodative IOLs rather
12 than multifocal IOLs. Accommodative intraocular
13 lenses are IOLs designed to provide uncorrected
14 vision over a continuous range of distances without
15 multifocality by producing an optical change in the
16 power of the eye through movement or through change
17 in shape of the optic. These are IOLs designed to
18 provide dynamic accommodation. Demonstrated proof
19 of efficacy is important for accommodative IOLs
20 and, perhaps even more so, if they are to be used
21 for the correction of presbyopia after clear lens
22 extraction.

23 [Slide]

24 Pseudophakic accommodation measurement is
25 important for patient informed consent, for patient

1 risk/benefit analysis, for clinical study design
2 and testing, for selection of clinical control
3 groups, for inclusion/exclusion criteria in
4 clinical trials, and in patient populations and for
5 product labeling following FDA approval.

6 [Slide]

7 I am going to ask more questions in this
8 presentation than I have answers for, and here are
9 some to start. What will the FDA consider as the
10 gold standard for pseudophakic accommodation
11 measurement? How will the FDA determine if the
12 benefits of an accommodative IOL outweigh the risks
13 of clear lens extraction? What kind of
14 accommodation testing will the FDA require for
15 accommodative IOL clinical study designs? Will
16 these be subjective tests, objective tests or a
17 combination of both? What tests or instrumentation
18 should researchers and clinical investigators
19 become familiar with for these clinical trials?
20 And, what kind of instruments will the FDA consider
21 as appropriate for objective accommodation
22 measurement, refraction to measure an optical
23 change in the eye versus, for example, A-scan
24 biometry to measure movements of an optic in the
25 eye?

1 [Slide]

2 I want to talk a little about subjective
3 testing of accommodation. Distance corrected near
4 visual acuity with subjective push-up test and
5 negative lens-induced defocus have long been, and
6 remain, clinical standards for accommodation
7 testing. These and other subjective tests are
8 easily implemented, are routinely used clinically.
9 They could readily be used in clinical trials and
10 they provide widely accepted indicators of
11 functional near vision, both for patients as well
12 as for clinicians. However, these tests are not
13 quantitative measures of accommodative amplitude
14 and they do not unequivocally demonstrate an
15 accommodative change in optical power of the eye.
16 What reliance will the FDA place on these and other
17 subjective tests for future clinical trials of
18 accommodative IOLs?

19 [Slide]

20 I want to talk a little about producing an
21 accommodative response. To measure accommodative
22 amplitude a full and maximum accommodative response
23 must be elicited from the subject or patient.
24 Accommodation can be stimulated with near or
25 proximal targets by inducing blur such as by

1 presenting minus lenses to induce defocus on a
2 distant letter chart, or with pilocarpine drops
3 directly applied to the eye. Some individuals
4 accommodate poorly in some conditions to pure blur
5 fuse for example.

6 If no accommodation is recorded, it does
7 not necessarily mean that the eye cannot
8 accommodate. It may simply mean the subject has
9 chosen not to accommodate. Pilocarpine drops on
10 the eye can be used to stimulate an involuntary
11 accommodative response. Will the FDA consider
12 pharmacologically stimulated accommodation for
13 determining efficacy of accommodative IOLs?

14 [Slide]

15 I would like to talk a little about
16 objective measurement of accommodation. Clinical
17 infrared autorefractors rely on analysis of
18 reflected light signals and often fail or are
19 inaccurate when light is reflected off high index
20 IOL materials.

21 Instruments often used to measure
22 accommodation objectively in research labs are no
23 longer commercially available. New developing
24 instruments are lacking validation, are not
25 routinely available now, and their availability in

1 the future may be uncertain.

2 Standard clinical autorefractors, while
3 tested and validated on phakic eyes, have not been
4 tested and validated in pseudophakic eyes and may,
5 in fact, not measure accurately or may not measure
6 at all in pseudophakic eyes. Lower accommodative
7 amplitudes expected of pseudophakic eyes will place
8 higher demands on the resolution of these
9 instruments.

10 [Slide]

11 Continuing with objective measurement of
12 accommodation, there is considerable uncertainty as
13 to the availability of instruments that are capable
14 of objective pseudophakic accommodation measure.

15 What objective instruments will the FDA
16 accept or mandate for future clinical trials of
17 accommodative IOLs? Have these instruments been
18 validation to accurately measure accommodation
19 either in pseudophakic or, in fact, in phakic eyes?
20 Will these instruments be able to reliably measure
21 pseudophakic eyes, and will these instruments be
22 generally available for placement at multiple
23 clinical sites?

24 [Slide]

25 I would like to talk a little about

1 comparison of performance with the standard or
2 monofocal IOL. Comparison with the standard
3 non-accommodative, non-multifocal IOL using
4 accepted subjective clinical tests, such as
5 distance corrected near visual acuity, can provide
6 an indication of whether an IOL provides functional
7 near vision beyond that which would be provided by
8 the standard IOL.

9 Will the FDA accept subjective comparisons
10 of near visual performance with standard IOLs for
11 clinical trials of accommodative IOLs? If so, what
12 level of improvement over the performance of a
13 standard IOL should be demonstrated? How many
14 standard IOL control patients are required to
15 demonstrate efficacy of an accommodative IOL?

16 [Slide]

17 Finally, I will end by asking a few
18 general questions about what is required to
19 establish efficacy. For accommodative IOLs is it
20 more important to establish the existence of
21 accommodation or to establish the amplitude of
22 accommodation?

23 If distance corrected patients can read at
24 near after implantation of an accommodative IOL, is
25 this adequate to establish efficacy?

1 Many products are FDA approved without a
2 fully elucidated mechanism of action because they
3 work. Would this be adequate for accommodative
4 IOLs?

5 How long a follow-up will be required to
6 demonstrate longevity of efficacy of accommodative
7 IOLs? And, will testing standards for FDA approval
8 be different for accommodative IOLs versus for
9 multifocal IOLs? Thank you very much.

10 DR. WEISS: Thank you, Dr. Glasser. If
11 you would remain at the podium for a moment, are
12 there any questions from the panel while Dr.
13 Glasser is up at the podium? Dr. Bradley?

14 DR. BRADLEY: Thank you, Dr. Glasser for
15 that presentation. I think you raise a very long
16 and challenging list of questions for the FDA and
17 it really would take too long to go through all of
18 them, but just a general question, you ask whether
19 pharmacologically induced accommodation would act
20 as a substitute for, let's call it, voluntary
21 accommodation. In your experience, do you have any
22 reason to believe that it is an effective
23 substitute, or do you think there may be, for
24 example, a possibility that although one can induce
25 accommodation pharmacologically the patient could

1 not activate their accommodative mechanism
2 willfully? Is that a possibility? Or, should we
3 be happy with pharmacologically induced
4 accommodation?

5 DR. GLASSER: I wouldn't suggest that as a
6 substitute. I don't think that it should be the
7 sole means of identifying whether an accommodative
8 IOL can produce an accommodative change. I do
9 think that it is an important addition perhaps to
10 the armament of tools that can be used to assess
11 the accommodative ability of an IOL.

12 Let me just add to that by saying that it
13 is well-known from the literature that myopes, for
14 example, have lower stimulus response functions
15 than emmetropes. So, there may well be some
16 individuals in the patient populations who struggle
17 to elicit an accommodative response even if active
18 accommodation is truly there, and it might be
19 important to understand whether the lens inside the
20 eye is capable of accommodation. I think the
21 pharmacological approach provides a useful tool in
22 that regard.

23 DR. BRADLEY: Thank you.

24 DR. WEISS: Seeing no other questions from
25 the panel, thank you very much, Dr. Glasser, for

1 your presentation. We are going to then have Dr.
2 Lane.

3 DR. LANE: Thank you, Dr. Weiss and
4 members of the panel for inviting me to share some
5 comments with you today about intraocular lenses
6 for presbyopia.

7 [Slide]

8 I am in private practice in the Twin
9 Cities. I am a clinical professor at the
10 University of Minnesota in ophthalmology and among
11 a number of different hats that I wear, I am a
12 clinical monitor for Alcon Surgical, for which I am
13 a consultant, and I am here today representing them
14 and they have paid my expenses to be here.

15 [Slide]

16 As a means of introduction, I would like
17 to talk about presbyopia as not being a normal
18 state and, as I take out my reading glasses to try
19 and read some of my notes, that certainly becomes
20 very evident. It is a progressive, degenerative
21 loss of the ability to accommodate and it is really
22 no different than an eye with any other refractive
23 error in that there is no structural damage done
24 but, clearly, it is not a normal eye.

25 The impact on the quality of life is

1 driving an increasing patient demand for spectacle-
2 and contact lens-free vision. There are very high
3 expectations of the generally younger patient
4 population for this as is certainly evidenced by
5 the popularity of corneal refractive surgery.

6 [Slide]

7 As I look at things, there are really two
8 pathways in which I think the agency can proceed.
9 One is with the practice of medicine, that is to
10 say let the market forces play themselves out. The
11 second is to recommend formal clinical trials.

12 [Slide]

13 With regard to the practice of medicine,
14 the existing off-label practice medicine approach
15 of refractive lens exchange--which I am using
16 synonymously with clear lens extraction so it
17 depends whether you are coming from a cataract
18 point of view or you are coming from a refractive
19 surgeon point of view--is accepted in the
20 ophthalmic community and is continuing, and this is
21 continuing without the approved surgical options to
22 address safety and efficacy. As we have already
23 heard, there have been no studies that have been
24 done looking at this in any long-term prospective
25 fashion, and despite inadequate information for

1 surgeon and patient informed consent.

2 [Slide]

3 Therefore, what is probably reasonable and
4 prudent is a refractive lens exchange clinical
5 trial. The development of a reasonable, adequate
6 and well-controlled study focusing on safety and
7 efficacy assessment that will allow for the
8 appropriate informed consent is essential. Well,
9 "reasonable" is certainly a very nebulous term but
10 what we are really talking about here is being
11 practical. What we are talking about is using the
12 already established safety record of modern
13 cataract surgery, and what we are talking about is
14 encouraging the use of existing regulatory
15 framework and guidance, wherever possible, from the
16 already existing body of information that we have
17 about cataract extraction and about refractive
18 surgery. We believe the study should also address
19 the functional outcomes which are so important to
20 this group of patients and is really what is
21 driving the entire procedure.

22 [Slide]

23 The parameters to measure are very
24 well-known and I don't think we have to reinvent
25 the wheel here. Existing regulatory guidance

1 already provides the sound basis for many study
2 measurement parameters: distance, intermediate and
3 near visual acuity and binocular defocus; stability
4 of refraction; contrast sensitivity; pupil size,
5 visual disturbances and adverse events; intraocular
6 lens observations and position; and certainly
7 quality of life.

8 [Slide]

9 As we look through the data, and we have
10 also done a very thorough literature search similar
11 to what was presented by Dr. Eydelman, we need to
12 mitigate the perceived risks with known outcomes
13 for modern cataract surgery. This would include
14 things like endothelial cell loss. Certainly, the
15 similarity, however, of this refractive posterior
16 chamber lens procedure to modern cataract surgery
17 eliminates, we feel, any need for ongoing
18 endothelial cell count measurements. We have a
19 body of evidence in terms of modern clinical
20 cataract surgery done in a modern fashion.

21 But retinal detachment--again, the
22 numbers, depending on where you look, vary all over
23 the board. The numbers that we looked at are
24 similar to those that were presented by Dr.
25 Eydelman and show that anywhere from 0.0-0.9

1 percent incidence of retinal detachment with modern
2 phacoemulsification techniques in the post-1980
3 era. This was modern cataract literature that was
4 surveyed for retinal detachment risk factors.

5 [Slide]

6 The risk factors that we identified that
7 we believe should be proposed as potential
8 exclusion criteria are similar to those that were
9 discussed by Dr. Eydelman. We too found that age
10 is a risk factor, especially less than 40; that
11 high myopia is a risk factor, especially greater
12 than 8 diopters; that axial length is a risk
13 factor, especially greater than 25 mm; and that any
14 history of peripheral retinal disease is a risk
15 factor.

16 Certainly, there are surgically-related
17 risk factors. Posterior capsule integrity is
18 critical. There is loss of posterior capsule if
19 there is vitreous loss. If there is a YAG laser
20 capsulotomy the incidence, as has been seen,
21 increases. However, with the use of modern lens
22 removal techniques and new foldable intraocular
23 lenses, I think that many of these risks can be
24 minimized. Most of the studies Dr. Eydelman
25 presented were from the early 1990s with larger

1 incisions, with PMA lenses, with different edge
2 designs and with different surgical techniques.
3 This is going to be a population of people that, by
4 and large, will have larger pupils; will have
5 softer lenses; will have many of the decrease in
6 risk factors that we now see in the cataract
7 population of patients that we are having to deal
8 with. So, we should be able to perform safer
9 surgery.

10 [Slide]

11 The results of our retinal detachment
12 literature survey shows that the retinal detachment
13 rate in lens removal patients, when applying the
14 proposed exclusion criteria that were just
15 mentioned on the slide, was no different than that
16 occurring in the untreated population, which is
17 between 0.0 and 0.1 percent with up to 8 years of
18 follow-up.

19 [Slide]

20 With regard to control groups, and we
21 certainly understand that this is a concern that
22 has been voiced by the agency with regard to the
23 study, efficacy goals really should be reasonably
24 met without creating overly burdensome
25 requirements. We feel we must reasonably weight

1 the potential issues for the patients against the
2 value of the information to be gathered. Is it
3 reasonable? Is it fair? Is it practical for a
4 patient who comes in desiring refractive lens
5 exchange to be randomized to no treatment? I think
6 we must use the existing guidelines that we already
7 have in place for refractive procedures, for laser
8 procedures as we proceed and look at the choice of
9 control groups.

10 [Slide]

11 In summary, we have a number of proposals
12 that we would like the panel to consider. First,
13 we would like to minimize the study size and the
14 duration by employing the proposed exclusion
15 criteria derived from the retinal detachment
16 survey. Based on an incidence of retinal
17 detachment of 1/1,000 using this exclusion
18 criteria, a clinical study that would be powered to
19 detect a difference would need to be an exceedingly
20 large sample size.

21 We would recommend that we apply the study
22 subject's own preoperative data to provide the best
23 method of control. This provides roughly the same
24 statistical power as using a non-operated control.
25 It is consistent with current guidance documents

1 and, importantly, it addresses the patient
2 considerations discussed previously.

3 [Slide]

4 We would ask to utilize the preoperative
5 endothelial cell minimum as an exclusion criteria
6 based on the FDA phakic IOL requirement in the
7 guidance that has already been given in that
8 respect. Finally, we would ask to employ the
9 appropriate quality of life assessments, as an
10 example the RSVP survey.

11 [Slide]

12 In conclusion, I would like to take off my
13 Alcon hat here for a moment and put on my hat as a
14 teacher and as a practitioner and as a leader of a
15 number of ophthalmic organizations. I recognize
16 that there are a number of various interests at
17 play here. From the patient's standpoint, we want
18 to meet the demand of their increasing interest in
19 being totally spectacle and contact lens free.

20 We want to provide safe and effective
21 treatment that is based on real information and
22 true informed consent. As a surgeon, I want to
23 provide the opportunity to deliver a service
24 desired by our patients which we can feel confident
25 about with regard to safety and efficacy.

1 As the FDA, I think you need and want to
2 fill a vacuum that presently exists and to set a
3 threshold of safety which we can live by and
4 industry, while certainly not in this for only
5 altruistic reasons, does want to produce products
6 that are safe and effective to fulfill patient
7 needs.

8 Finally, one that is not listed is
9 societal. Refractive lens exchange allows the
10 potential for generations to come to reach Medicare
11 age with their lenses already removed, saving
12 government billions of dollars and, thus, becoming
13 the ultimate cataract preventative.

14 [Laughter]

15 All joking aside, I do see a real
16 opportunity here but unless reasonable and
17 practical considerations are employed, this
18 increasingly popular procedure will continue to be
19 performed outside the scope of the best interests
20 of the above parties. Thank you.

21 DR. WEISS: Thank you, Dr. Lane. Do we
22 have any questions from the panel? Dr. Grimmett?

23 DR. GRIMMETT: Dr. Lane, thank you for
24 your presentation. I have a question regarding
25 slide 7. I did a literature review over the last

1 year or so when we discussed phakic IOLs and
2 endothelial cell loss and the long-term endothelial
3 cell loss rates we have been basing off old data
4 from Bill Bourne regarding procedures that we
5 really no longer perform. You indicated on your
6 slide that we have known outcomes with modern
7 cataract surgery for endothelial cell loss rates
8 and I was wondering if you could direct me to the
9 literature reference or data regarding those known
10 outcomes.

11 DR. LANE: I am sorry, Mike, I misspoke.
12 As you well know, there are no known--basically I
13 am using the numbers that have been used, and have
14 been used by the agency to go forward with a number
15 of the other studies that have gone forward and
16 approval processes for new intraocular foldable
17 lenses, and so on, using those data. I guess from
18 a historical perspective, if you will, the basis of
19 the endothelial cell counts from studies that have
20 been performed most recently with more modern
21 intraocular lenses, foldable intraocular lenses,
22 that have achieved approval by the agency seems to
23 be sufficient to allow approval of those particular
24 lenses. So, really I guess what I am referring to
25 is data that has been presented from previous

1 applications, if you will, of foldable intraocular
2 lenses and the endothelial cell counts coming from
3 those and coming from oncoming studies that will be
4 looking at some new foldable lenses coming down the
5 line. So, from a literature standpoint in terms of
6 going back and looking at the literature and is
7 there something out there that you have missed, the
8 answer is no.

9 DR. WEISS: Dr. Mathers?

10 DR. MATHERS: Thank you for your
11 presentation. I have a similar question regarding
12 the rate of retinal detachment. It would seem that
13 your slide suggesting that the rate of retinal
14 detachment in a select group after cataract surgery
15 is no greater than those that do not have cataract
16 surgery. But we heard this morning of several very
17 large studies indicating that the retinal
18 detachment rate is considerably higher, and also is
19 highest in the youngest population for which we
20 seem to have the least amount of data. Could you
21 explain this discrepancy?

22 DR. LANE: I really don't see that there
23 is a discrepancy, Dr. Mathers, because the
24 literature that was discussed this morning included
25 the entire cohort. What we are doing is separating

1 out the high risk factors. We are separating out
2 the patients with high axial lengths. We are
3 separating out the patients with high degrees of
4 myopia. We are separating out patients with known
5 peripheral retinal disease. So, the numbers that
6 were given that are higher are based on the entire
7 cohort that would include those while this group
8 includes only those that have those exclusion
9 criteria.

10 DR. MATHERS: But do we have literature
11 that shows what the detachment rate in the younger
12 population with cataract surgery actually is?

13 DR. LANE: I don't know the answer to
14 that, and I certainly don't think we know--I don't
15 know the answer to that.

16 DR. WEISS: Just as a follow-up question
17 to that, if we are going to be suggesting that they
18 should be used in younger patients or used in
19 higher myopes, what would you suggest then be used
20 in those cases that we don't have the answer for
21 adverse event follow-up in terms of duration as
22 well as percentage?

23 DR. LANE: A very good question. I don't
24 obviously have the answer to that either, but I
25 think that in the same way in which Dr. Eydelman

1 suggested that the introduction of any presbyopic
2 lens be performed in a cataract population first,
3 the next logical step to me would be to perform it
4 in a group that included certain exclusion criteria
5 that we are talking about. If that trial proves to
6 be successful, as it would have to be if it was
7 going on to the next step, then the next step would
8 be to try some of the higher risk population and
9 perform adequate studies to be able to show that.

10 DR. WEISS: Just a follow-up question, if
11 you were putting this study together what would you
12 want in terms of range of refractive error? It
13 sounds like you would be suggesting that the
14 refractive errors that are most in demand to have
15 this done, namely the very high myopes, be
16 eliminated from an initial study and the younger
17 patients be eliminated from an initial study. Or,
18 am I misreading what you are saying?

19 DR. LANE: No, you are not misreading what
20 I am saying. I think that, you know, based on the
21 literature search that we did looking at the
22 exclusion criteria that are present, that is the
23 group of patients that I think should be targeted.
24 While, yes, the high myopes would certainly benefit
25 potentially from this kind of technology and may be

1 the ones who would really sort of gather at your
2 doorstep to do this in greatest numbers, for the
3 time being certainly all of the literature suggests
4 that those patients are at higher risk. So, I
5 think, again, that may be a study that needs to be
6 done in a better fashion using more modern
7 techniques but I think we have to get there
8 probably in a step-wise fashion rather than trying
9 to do it.

10 I wouldn't necessarily agree that the
11 majority of patients who would want to have this
12 are necessarily the high myopes. There is a whole
13 group of presbyopic patients out there who would
14 want to have this for presbyopic reasons. While
15 that certainly is an important group, it is
16 certainly not the only group and may not even be
17 the largest group.

18 DR. WEISS: Dr. Stark, did you have a
19 question?

20 DR. STARK: You did show a reference on
21 slide 9, Solomon, indicating that the retinal
22 detachment risk was 0.1 percent. It went by so
23 fast I didn't get it--

24 DR. LANE: That is in the untreated
25 population. That is very similar to the

1 information that Dr. Eydelman presented. It is
2 essentially a control group, if you will.

3 DR. STARK: Oh, okay. Good.

4 DR. WEISS: Seeing no other questions from
5 the panel, thank you very much, Dr. Lane, for your
6 presentation. Dr. Randall Olson has a letter that
7 Sally Thornton will be reading as part of the open
8 public hearing presenters.

9 MS. THORNTON: This is a letter from Dr.
10 Randall Olson, who is the John A. Moran
11 Presidential Professor and Chair of the Department
12 of Ophthalmology and Visual Scientists, and
13 Director of the John A. Moray Eye Center at the
14 University of Utah Health Science Center:

15 I would like to comment on the use of
16 intraocular lenses for correction of presbyopia
17 after clear lens extraction, a topic that is to e
18 discussed by the Ophthalmic Devices Panel of the
19 Medical Devices Advisory Committee on Friday, March
20 5, 2004. We have performed about 100 "clear"
21 lensectomy procedures in presbyopes over the past
22 two years. The term "clear" lensectomy is a
23 misnomer for us. In our patient population, it is
24 rare for a presbyopic patient not to have some
25 level of lens opacification, even though it may not

1 be significantly decreasing their Snellen visual
2 acuity. In a study, done by Waltz, Wallace in
3 Ophthalmic Practice, 2001, of over 200 refractive
4 lensectomy patients, the average age at surgery was
5 53 years, our average is even older. We feel that
6 we are doing these patients a disservice to perform
7 corneal surgery, such as LASIK, when cataract
8 surgery due to further lens opacification may be
9 just around the corner. The precision of the
10 refractive component of cataract surgery drops
11 precipitously for post corneal refractive patients,
12 and it is precisely this group that demands
13 refractive precision.

14 For the patient, clinical studies have
15 shown a high rate of patient satisfaction with
16 refractive lensectomy. They perceive being
17 "spectacle free" as an improvement in their quality
18 of life. With the present levels of refractive
19 precision, the acceptance rate is as good as, or
20 better than, LASIK.

21 The only concern for refractive lensectomy
22 that could conceivably be greater than cataract
23 complications is the possibility of an increased
24 rate of retinal detachment following surgery in
25 high myopes. The retinal detachment risk is not

1 germane for emmetropes or hyperopes. We have
2 published several studies in this area, Powell,
3 Olson Journal of Cataract and Refractive Surgery,
4 1995, Olsen and Olson in the Journal of Cataract
5 and Refractive Surgery, 1995, and Olsen and Olson
6 in the Journal of Cataract and Refractive Surgery,
7 2000, showing a decrease in the rate of retinal
8 detachment as surgical techniques and equipment
9 have improved. For high myopes, the risk probably
10 can be reduced by careful prescreening and the use
11 of a phaco technique that maintains the depth of
12 the anterior chamber during surgery. It should
13 also be noted that the lens is less dense and more
14 easily removed in refractive lensectomy patients
15 than cataract patients. This reduces surgical
16 complications for this group.

17 In spite of the issue of retinal
18 detachment in high myopes, which has been
19 investigated in multiple studies, a prospective
20 study of "clear" lensectomy does not seem
21 warranted, in that our cataract database is already
22 so large and so inclusive. In addition, to truly
23 study "clear" lensectomy in presbyopic patients
24 would be extremely difficult since few of these
25 patients have clear lenses.

1 Signed, Randall J. Olson, M.D. Thank you.

2 DR. WEISS: Thank you, Sally. That will
3 conclude the open public hearing session. We will
4 break for 15 minutes before beginning the panel
5 deliberations.

6 [Brief recess]

7 **Panel Deliberations**

8 DR. WEISS: We are now going to open the
9 panel deliberations session and I will ask, Dr.
10 Eydelman, if you could come to the podium and
11 perhaps we could use the questions as a guidance.
12 Actually, perhaps Dr. Blustein could come forward
13 as well so that if there are any questions for the
14 FDA from their panel presentation we could have the
15 panel ask those at this time. Do any of the panel
16 members have questions for FDA? Dr. Ho?

17 DR. HO: Malvina, just a question on the
18 FDA grid for PC IOLs, what is that data derived
19 from?

20 DR. EYDELMAN: One second and I will show
21 you, I am just going to put the slide up.

22 [Slide]

23 This was a composite of all the PMA data
24 that was performed. As you see, the total N was
25 5,906 eyes. This particular grid encompasses all

1 surgeries from '87 to '96.

2 DR. HO: So, it is a mixed bag with
3 respect to the way the cataracts were removed I
4 suspect.

5 DR. EYDELMAN: Correct. We actually
6 looked at this specific question two days ago
7 because we were considering it under ISO. We have
8 unofficially re-looked at what these numbers would
9 be if we just moved it forward.

10 MR. CALOGERO: At the last ISO meeting
11 this week we looked at updating the grid and we did
12 some early, preliminary work. Unfortunately, I
13 don't have the grid values. They changed somewhat
14 but what we did, we truncated off the oldest PMAs
15 and now, if you look at the data from 1994 out to
16 2003, there are minor changes in these rates but
17 the retinal detachment rate goes down somewhat.

18 DR. EYDELMAN: The only number that was
19 significantly different was the CME. It went from
20 3 percent to 1.5 percent. But since that was
21 unofficial, sort of our little draft, we didn't put
22 that up. This is the official FDA grid that the
23 companies have been comparing their IOLs to.

24 DR. HO: Thank you.

25 DR. WEISS: Dr. Grimmett?

1 DR. GRIMMETT: A question in follow-up,
2 Dr. Eydelman, did the hyphema rate go down?

3 DR. EYDELMAN: Slightly.

4 GRIMMETT: Slightly?

5 DR. EYDELMAN: Slightly. For the purposes
6 of ISO, we were looking if it would change at all
7 our sample size for determination and it didn't.

8 DR. GRIMMETT: That is surprising to me
9 because, at least in my clinical practice, it is
10 just not common to see hyphema after modern phaco
11 surgery. So, I am just surprised by that.

12 DR. EYDELMAN: I think it was 1.5. I
13 don't want to quote, I don't have the numbers but
14 it was over 1 percent. Again, cumulative is
15 defined as occurring any time between surgery to
16 one year. It is just additive.

17 DR. WEISS: Mr. McCarley?

18 MR. MCCARLEY: Yes, Rick McCarley. I have
19 three quick questions. Hopefully, they will have
20 quick answers. Are we limiting the discussion
21 today to multifocal lenses and accommodative IOLs
22 or are we also talking about standard monofocal
23 IOLs where you would use monovision, for instance?
24 In other words, any IOL that is placed in the eye
25 to correct the patient who can no longer

1 accommodate?

2 DR. EYDELMAN: The discussion was intended
3 to be limited to the correction where the subjects
4 have both distance and near VA for correction of
5 presbyopia.

6 MR. MCCARLEY: So, not for monofocal IOLs?

7 DR. EYDELMAN: Well, it could include
8 accommodative.

9 MR. MCCARLEY: That is not accommodative?

10 DR. EYDELMAN: Correct. It is for those
11 IOLs that simultaneously provide distance and near
12 VA corrections.

13 MR. MCCARLEY: Okay. The second question
14 is what is the FDA's current labeling for, for
15 instance, accommodative IOL or the multifocal IOL
16 related to the age range that they suggest? In
17 other words, my understanding is it used to be 60
18 years and older but that was changed later on to be
19 adults not less than 18 or not less than 21. Is
20 that correct?

21 DR. EYDELMAN: Currently all IOL sponsors
22 may require an indication for the adult population,
23 but that is for IOLs status post cataract
24 extraction, correct.

25 MR. MCCARLEY: My final question is the

1 FDA knows that this clear lens extraction has been
2 going on for a while and knows that it is
3 increasing in popularity. Has the FDA, in the
4 interest of public health, done anything to inform
5 doctors or patients now, working with maybe the AAO
6 or the SCRS, to let them know what we know now so
7 that they will be better informed for what we know
8 is going on? In fact, what do you have planned
9 between now and when any study might be completed?

10 DR. EYDELMAN: Well, as I mentioned, it
11 has only been done as off-label and, as such, it
12 has been quite an issue. Off-label means we do not
13 have an approved indication with safety and
14 efficacy data that we can share.

15 MR. MCCARLEY: So, you recognize there is
16 a potential public impact but the FDA doesn't feel
17 they can do anything right now to notify the
18 doctors or the patients?

19 DR. WEISS: Do you want to comment on
20 that, Ralph?

21 DR. ROSENTHAL: We are a regulatory agency
22 that regulates the medical device industry and it
23 is not our responsibility to inform the public
24 about issues regarding off-label use unless we feel
25 there is a significant public health issue.

1 MR. MCCARLEY: I thought that was how Dr.
2 Eydelman's presentation started off, that this is a
3 significant, major public health issue.

4 DR. EYDELMAN: No, my presentation started
5 off that if CLE for correction of presbyopia
6 becomes widely used it can have a significant
7 health impact. As an aside, I said that CLE has
8 been performed as off-label use, mostly for high
9 refractive errors. Those two are two distinct
10 ideas.

11 DR. WEISS: I think also some companies
12 would like to get this on-label so I don't believe
13 it is just being driven by FDA. Dr. Mathers?

14 DR. MATHERS: Is there any data indicating
15 that the movement of an accommodative IOL would
16 have any bearing on, say, position of the vitreous
17 space or affect retinal detachment, uveitis or
18 endothelial cell loss? In other words, there
19 appears to be no downside to an accommodative IOL
20 that changes its position but there might be
21 compared to another kind of straight IOL. Do you
22 have any data on that?

23 DR. EYDELMAN: No, we don't. We only have
24 one, as you know, IOL currently approved so we have
25 very limited information on that issue.

1 DR. WEISS: Any other questions from the
2 panel? Seeing no other questions, we can then
3 address the first question that the FDA is asking.

4 1 A), do you recommend a control
5 population for studies of clear lens extraction in
6 the correction of presbyopia, or do you believe
7 that the study subject's own preoperative data is
8 sufficient for comparison?

9 This is basically going to be a yes or no,
10 and I want to poll each of the panel members if
11 they want a control population or is the study
12 subject's own preoperative data sufficient? We
13 will start with Dr. Maguire. Would you like a
14 control population, Dr. Maguire, or is preoperative
15 data from the patient enough?

16 DR. MAGUIRE: I am going to pass right
17 now.

18 DR. WEISS: We have an abstention. Dr.
19 Stark?

20 DR. STARK: Well, I think it would be
21 difficult to randomize patients, if they wanted
22 this procedure, to no treatment or treatment. So,
23 I think we could get enough information on
24 complications if we had adequate long-term
25 follow-up. My primary concern would be the retinal

1 detachment rate even in young people who are not
2 myopic. So, I think we could get this from
3 historical control or age-matched populations. So,
4 I don't think a randomized, controlled study is
5 necessary in this.

6 DR. WEISS: I am just going to step back
7 for this question, for part A), it is not actually
8 the type of control population but whether or not
9 you want a control population. From what I
10 understand from what you are saying, you do want a
11 control population but not something so onerous
12 but, still, you would like a control population.
13 Is that correct?

14 DR. STARK: Yes.

15 DR. WEISS: Dr. Brown?

16 DR. BROWN: Yes, I do feel strongly about
17 that. I would like there to be a control
18 population, particularly if we include high myopes
19 in any of thee studies.

20 DR. WEISS: So, you would like a control
21 population as well. Dr. McMahon?

22 DR. MCMAHON: A question--we are jumping
23 right into controls but are we talking from a
24 perspective of efficacy or safety, or both?

25 DR. EYDELMAN: We are talking with respect

1 to study design.

2 DR. BRUCKER: Can I raise a question?

3 DR. WEISS: Actually, what I would like to
4 do is not have a discussion now but sort of get a
5 feeling for where people are at. Then, once we get
6 involved in the type of control population we will
7 break it up into discussion.

8 DR. BRUCKER: Could I still ask the
9 question because it is applicable to what you are
10 asking.

11 DR. WEISS: Okay, Dr. Brucker.

12 DR. BRUCKER: Clear lens extraction is a
13 surgical procedure--

14 DR. WEISS: Yes.

15 DR. BRUCKER: That surgical procedure can
16 be done by any physician at any time, period.

17 DR. WEISS: A hundred percent correct.

18 DR. BRUCKER: The risks and complications
19 that we are talking about have to do with clear
20 lens extraction. It has nothing to do with the
21 insertion of an IOL. So, the question that you are
22 posing seems to be a question that can't be taken
23 out of that context. The insertion of an
24 intraocular lens is not assumed, from my
25 understanding, to be the cause of the complication.

1 Therefore, the use of a surgical procedure called
2 clear lens extraction should have nothing to do, in
3 my opinion, with whether you put in monovision,
4 presbyopic vision or anything else; it is clear
5 lens extraction. Perhaps we should have a little
6 bit of discussion about the issue of clear lens
7 extraction before you start talking about
8 intraocular lenses.

9 DR. WEISS: I think technically what you
10 are saying from a purist standpoint is correct,
11 however, when IOLs get evaluated they get evaluated
12 in terms of hyphema and retinal detachment rate
13 and, from what you are saying, they shouldn't be
14 evaluated in that way either because the IOL is not
15 causing the RD or the hyphema but, yet, it is
16 included in the surgical procedure and when the
17 patient is going in for that surgical procedure you
18 can't separate out for them that, oh well, this is
19 the part that caused it and this part didn't cause
20 it.

21 So, for the purpose of this discussion,
22 although your points are well taken and FDA can
23 correct me, I think it doesn't really apply. We
24 still have to put it all together because when a
25 patient is looking at it, who is 45 years old, who

1 is a minus 15, whether they are getting the RD 7
2 years down the line from the IOL or they are
3 getting it from the surgical procedure they are
4 still going to end up with an RD and that is the
5 information they need. Agency, would you agree?

6 DR. EYDELMAN: You are absolutely correct
7 because we are talking about approval of a
8 particular IOL for a specific indication and that
9 indication would incorporate a clear lens
10 extraction which would precede the implantation.
11 So, it is looked at as a package deal.

12 DR. BRUCKER: Yes, but you presented
13 Ripandelli's work and many of the eyes in
14 Ripandelli's work didn't have IOLs. They had clear
15 lens extraction and they had retinal detachments.
16 It is the retinal detachment coming from the clear
17 lens extraction that really is the subject of
18 discussion.

19 DR. WEISS: Dr. Brucker, as I said, I
20 think from a logical technology standpoint, you are
21 right but it doesn't apply to what the agency wants
22 at this point. Dr. Bressler?

23 DR. BRESSLER: I think you do need a
24 control, and it will be more interesting discussing
25 what that will be on the second round.

1 DR. WEISS: Dr. Smith?

2 DR. SMITH: I agree, you need a control
3 both for safety and efficacy.

4 DR. WEISS: Dr. Ho?

5 DR. HO: The clinician scientist in me
6 wants an active control, however, I recognize the
7 difficulty of executing a trial in which someone is
8 seeking a refractive procedure and would be
9 randomized--

10 DR. WEISS: Just to reiterate, we don't
11 have to commit--

12 DR. HO: I would be okay with historical
13 age and refractive-matched controls.

14 DR. WEISS: All I want from anyone right
15 at this moment is do you want a control or you
16 don't want a control. I am going to keep it nice
17 and simple. It won't stay simple for long so enjoy
18 it while you have it. Dr. Mathers?

19 DR. MATHERS: By patients on control, are
20 you supposing that you do the surgery in one eye
21 and not on the other?

22 DR. WEISS: Well, any type of control you
23 want. It is just question 1 (A, do you want a
24 control or you don't want a control? You are going
25 to tell us afterwards what sort of control you

1 want.

2 DR. MATHERS: I want a control.

3 DR. WEISS: You want a control. Dr.

4 Grimmett?

5 DR. GRIMMETT: Yes.

6 DR. WEISS: Dr. Grimmett wants a control.

7 Dr. McMahon?

8 DR. MCMAHON: Yes.

9 DR. WEISS: Dr. Bradley?

10 DR. BRADLEY: I am not sure.

11 DR. WEISS: Another abstention. Dr.

12 Ferris?

13 DR. FERRIS: We have to have some sort of
14 comparison group so the answer of who wants some
15 sort of comparison group is simple, so I want a
16 comparison group.

17 DR. WEISS: Thank you. Dr. Brucker just
18 nodded in the affirmative. Mr. McCarley, you can
19 voice your opinion, of course.

20 MR. MCCARLEY: I was just thinking of the
21 same patient control.

22 DR. WEISS: Okay, and Dr. Maguire, did you
23 want to voice an opinion at this point?

24 DR. MAGUIRE: Well, yes, because we
25 haven't really established what we are talking

1 about so I don't want to say no.

2 [Laughter]

3 DR. WEISS: I take that as a continuation
4 of an abstention. I am hearing somewhat of a
5 consensus on 1 A), that most of the panel would
6 like to have a control population. So, now we get
7 into 1 B), which is on the screen, what type of
8 control population would you like. We have the
9 historical and the active, or if you can come up
10 with anything else. I don't believe the FDA was
11 emphasizing doing a randomized study. I don't
12 really think anyone is talking about that, but if
13 that is what you want to do you can certainly
14 suggest it. In the list of controls under
15 historical under 1 B) there are subjects--well, you
16 can read them yourself. There are four different
17 types of historical controls. There is one type of
18 active control, and then if there is anything else
19 that you would like. Dr. Rosenthal?

20 DR. ROSENTHAL: The active control would
21 be a group of patients who had no surgery. So, in
22 fact--

23 DR. WEISS: It could be randomized.

24 DR. ROSENTHAL: --you could randomize or
25 you could just collect a group of patients.

1 DR. WEISS: Then the randomization is
2 actually another level of specificity. You could
3 have an active control of another group of, let's
4 say, age- and gender- matched subjects, and how you
5 wanted to include them in the study, actually, the
6 FDA has not even asked us. So, they haven't even
7 asked us for that level of detail.

8 Let's start with Dr. Maguire, if you
9 wanted to voice your opinion on this.

10 DR. MAGUIRE: Yes, I think active control
11 subjects with no previous ocular surgery and not
12 planning on having any either for presbyopia would
13 be reasonable.

14 DR. STARK: Agreed.

15 DR. MAGUIRE: Because we have no
16 information on retinal detachment surgery in young
17 people, or certainly not adequate information, and
18 we would like to have more information on
19 endothelial cell loss based on Dr. Lane's answer to
20 Dr. Grimmatt's question, so absolutely.

21 DR. WEISS: So, you would like an active
22 control of subjects with no previous ocular
23 surgery. Dr. Stark agreed with that. Dr. Brown?

24 DR. BROWN: Yes, an active case control
25 study that is matched on criteria that we would set

1 out in terms of refractive error and age, yes.

2 DR. WEISS: So, you would also like an
3 active control. Dr. Bressler?

4 DR. BRESSLER: I would like to discuss for
5 a minute a couple of considerations for why a
6 randomized control might be beneficial for getting
7 the answer and then we can get back to would those
8 people actually enroll.

9 We may see some visual acuity loss in a
10 few of these people that have this. In the few
11 studies that were done, granted in the high myopes
12 with clear lens extraction they did have one or two
13 people that are 40 losing a line of vision by six
14 months, for example, in their best corrected visual
15 acuity. Now, that could be to the detriment of
16 this if you didn't have a control group because you
17 would say, well, they started at 20/16 and they
18 dropped to 20/25, or something. However, it could
19 be that your control group developed some cataract
20 along the way. We are going to have 50 year-olds
21 with presbyopic symptoms, or whatever, and they may
22 drop to 20/25 just as often. So, you never would
23 have known that you weren't harming their vision,
24 for example, more than if you left it alone if you
25 didn't have a control group for that.

1 In addition, if you are going to look at
2 quality of life outcomes, for example, whatever
3 answers or change in the quality of life you get in
4 someone over time, you just won't know if that is
5 just due to the person having the surgery done and
6 being happy with their life or if it is due to
7 other factors that you would only get from a
8 control group.

9 So, I am all for an active control and I
10 think it needs to be considered as actually a
11 randomized trial to be able to answer the important
12 safety issue, which will be visual acuity besides
13 the retinal detachment, which is much rarer and you
14 may not be able to detect those changes, and any
15 quality of life studies that might be considered
16 down the line.

17 DR. WEISS: I would ask you if this could
18 not be a randomized study because it was deemed
19 that it would be too burdensome or the study
20 wouldn't be able to accrue the patients because of
21 that criteria, would you still want an active
22 control? Would that still be something that you
23 would want?

24 DR. BRESSLER: If you couldn't have it,
25 then yes, but you might not be able to answer these

1 questions if you see that the visual acuity has
2 declined. So, I just don't want to have the
3 industry paint themselves into a corner. That is
4 the whole advantage of doing this ahead of time.

5 DR. WEISS: Dr. Eydelman?

6 DR. EYDELMAN: Along the lines of what Dr.
7 Bressler just mentioned, the panel certainly can
8 consider whether they wanted two different controls
9 for safety and efficacy outcomes. If that is the
10 case, that just puts a little further question into
11 question 1 B).

12 DR. BRESSLER: I am not separating it
13 because safety assessment depends on what the
14 efficacy is as well. You are willing to take big
15 safety risks for one sort of efficacy and less
16 safety risks for another.

17 DR. EYDELMAN: Right, but determination of
18 safety and efficacy with an active control is going
19 to require greatly different sample sizes. Just
20 keep that in mind.

21 DR. WEISS: Dr. Smith?

22 DR. SMITH: I would prefer to have an
23 active control while recognizing these concerns
24 that several have voiced regarding the feasibility
25 of doing such a study, and I am open to discussing

1 ways to do that other than randomization but I do
2 believe in active controls. It is critical to
3 obtaining safety data in this age group for which
4 we do not have good data.

5 DR. WEISS: Just to remind panel members,
6 we welcome dissent. We don't need unanimity on
7 this. This is really to guide the agency as far as
8 the panel's sentiments so we don't have to have a
9 continual roll here if you want to go in another
10 direction. Dr. Ho?

11 DR. HO: As I was saying before, as a
12 scientist I think that I would love to have an
13 active control. I think it would be very difficult
14 to execute that study. I think Neil's concern and
15 point is a good one, however, the duration of the
16 study will likely not be long enough so that maybe
17 those 1/40 patients that drop a line might not drop
18 a line in the first few years.

19 DR. WEISS: Would you be able to get a
20 little closer to the mike?

21 DR. HO: Sure. Therefore, I would be open
22 to a historical control but it would have to be an
23 age-matched and refractive error-matched control.

24 DR. WEISS: Would that be difficult to do,
25 Dr. Eydelman? I just saw a change in your

1 expression, not for the positive.

2 DR. EYDELMAN: Well, that would imply that
3 each sponsor, depending on the inclusion/exclusion
4 criteria, would have to go through the literature
5 and try to see if they can pull--most of the
6 articles don't have raw data so you would have to
7 try to identify articles that have exactly the same
8 age criteria as you wish to enroll. It gets a
9 little tricky. We have done it for glaucoma
10 devices and the sponsors found it quite difficult.

11 DR. WEISS: Dr. Bressler?

12 DR. BRESSLER: I just wanted to add to
13 Allen's comment that in the small series we had
14 from Dick and colleagues, that was only a six-month
15 follow-up and they had 3/50--and I know these are
16 broad confidence intervals but that was six percent
17 losing one line. So, you might get those answers
18 even with just a year follow-up or safety beyond
19 two years.

20 DR. WEISS: Dr. Ho?

21 DR. HO: That was also a group that was
22 highly myopic that might be more susceptible than
23 the general group you are speaking to here who
24 would like to have presbyopic surgery.

25 DR. WEISS: So, Dr. Ho, you still would

1 prefer to have a historical?

2 DR. HO: If that data can be derived, yes,
3 because I think consideration of an active
4 control--although burdensome and I would love it
5 but I think it would be difficult to execute that
6 trial.

7 DR. WEISS: Would I be able to ask you to
8 sort of isolate one of the four listed here as far
9 as what type of historical control? No, I would
10 not be able to? Okay, well, I can ask. Dr.
11 Mathers?

12 DR. MATHERS: I don't think it would be
13 that difficult to have an active control because
14 you are not really doing too much for these people
15 if they haven't had surgery. You are just
16 following them and you are doing some tests on
17 them. But I think that you would have to stratify
18 them to answer some of the questions. You would
19 have to stratify them by axial length, refractive
20 error, endothelial count and age. If you did that,
21 you could answer these questions and I do think it
22 is extremely important to answer these questions.
23 We are talking about really major health issues
24 here that affect millions, if not billions, of
25 people and, clearly, the private community or the

1 academic community have all completely failed to
2 look at this fundamental issue and maybe we have an
3 opportunity to help them. We haven't answered
4 these questions yet. Obviously, the literature
5 shows we have not.

6 DR. WEISS: Dr. Grimmett?

7 DR. GRIMMETT: For effectiveness issues I
8 would be in favor of an active control. Certainly
9 for quality of life issues it would be very nice to
10 compare patients who have not had surgery with time
11 to see how their quality of life compares to those
12 who have had the surgery.

13 Dr. Eydelman read my mind as far as
14 separating safety and effectiveness. I could go
15 with a historical control for safety issues,
16 perhaps patients who have had cataract surgery with
17 IOLs.

18 DR. WEISS: I have just been informed
19 that, unlike many panel meetings, my opinion is
20 actually wanted on this one even though I am
21 chairing this. So, I think I would like an active
22 control as well because of the frustration I think
23 for a sponsor as well as the panel often when the
24 PMA is presented and we don't have the information
25 to assess--let's say, the risk or whatever--and the

1 best way to do that is to compare it to an active
2 control. Although randomization would be
3 wonderful, I think it would be too onerous on the
4 sponsors so I wouldn't be supporting that. Dr.
5 McMahon?

6 DR. MCMAHON: I have a few comments on
7 this issue. I agree with Dr. Bressler that a
8 randomized trial with an active randomized control
9 group would be ideal, but I also agree with you
10 that it would be a bit onerous to maintain an
11 active control group for a period of three or four
12 years. Keep in mind, this is equivalent to a
13 refractive surgery population and keeping track of
14 the patients is hard enough, let alone controls who
15 might also be interested in this procedure. If you
16 are going to hold them off for several years I
17 think it would be very difficult to manage this.

18 With regard to active controls, I think
19 there are other mechanisms that can be played and I
20 think it can be done in a variety of interesting
21 ways. For the less common but more devastating
22 complications like retinal detachment I can see a
23 design where you have a prospective case control
24 kind of circumstance where you have a lot of active
25 controls who are not interested in the procedure

1 and a lesser number of actually operated patients.

2 But for things like efficacy you are going
3 to want more of a matched controlled set of
4 patients in that circumstance. So, I think an
5 active control group is the thing to do. I think
6 randomization is likely not to be manageable but
7 there are other options I think that can be looked
8 at.

9 DR. WEISS: Dr. Bradley?

10 DR. BRADLEY: Yes, I have several
11 comments. I think taking Dr. Brucker's comment
12 earlier to heart in that potentially the greatest
13 risk here is the surgical procedure not the lens
14 being inserted into the eye, one might not imagine
15 dramatically different risks associated with
16 different lenses. So, we may, therefore, be able
17 to employ historical literature controls for risk,
18 particularly in the age group that has already
19 undergone this particular surgery, which is
20 obviously the 50-plus age group and they have
21 obviously been having surgery for cataracts. So,
22 this may be effectively evaluated using historical
23 controls in the older group. That is certainly not
24 the case if the lenses are going to be inserted in
25 younger eyes. I think in that case an active

1 control for risk is required.

2 Regarding controls for efficacy, clearly,
3 if we are going to be reviewing novel multifocal or
4 novel accommodative IOLs, I think efficacy will
5 require an active control. So, again, I am sort of
6 dividing it between safety and efficacy. I think
7 efficacy will require active controls even in the
8 older group but safety may not.

9 DR. WEISS: Dr. Ferris?

10 DR. FERRIS: Some people may be shocked to
11 hear me say this. In fact, I am shocking myself to
12 say this, but I agree with Malvina that we need to
13 look at this separately for safety and efficacy and
14 I am saying that in part not, as Allen says,
15 because of what is scientifically best but what is
16 reasonable to do. From my perspective the
17 appropriate control group, particularly for these
18 younger people that are considering to have this
19 done for presbyopia, is the unoperated group. The
20 choice is wearing glasses and the risk of wearing
21 glasses is pretty low.

22 So, the underlying rates that have been
23 presented today for retinal detachment and
24 endothelial cell loss are probably the appropriate
25 rates to look at. They are so low that if you

1 tried to figure out the sample size that would be
2 necessary to have reasonable confidence intervals
3 around those rates, it is sort of an impossible
4 study. So, from one perspective I would think that
5 you would take the point of view that for safety
6 the rate is almost zero or very low. So, what you
7 want to know is what is the rate if you do this
8 procedure and I would bundle the whole procedure as
9 you were mentioning, the surgery plus the lens,
10 plus everything. So, from the safety side I think
11 that is the way that I would do it so I am saying I
12 guess historical controls.

13 Efficacy is a different issue I think
14 because now you can have an appropriate sample size
15 and, as Neil pointed out, whatever it was, 6
16 percent loss or 3 percent one line loss is what you
17 would find if you just repeated the visual acuity
18 the same day. There is a certain 5-letter change
19 in our experience. So, usually I say results are
20 always improved by omitting the control group. In
21 this case they are worsened by omitting the control
22 group. So, i would think from the company's point
23 of view they probably want an active control group
24 and that control group may be several things. One,
25 as mentioned here, their preexisting state, which I

1 think is a very important control group and,
2 secondly, maybe a comparable group, particularly if
3 you are going to look at changes over time and
4 quality of life. I also agree that doing a
5 randomization trial is virtually impossible. On
6 the other hand, uncontrolled confounding is going
7 to be an impossible issue to deal with when you
8 don't have a randomization comparison. So, it is
9 sort of skewed either way.

10 DR. WEISS: I think both Dr. Bradley and
11 yourself bring up a very good point. Just to sort
12 of elucidate it a little bit further, if you are
13 going to be doing a historical control for safety,
14 could you just clarify which one of those groups
15 you would both be using?

16 DR. FERRIS: From my view, it is the
17 untreated group, and the only caveat there is this
18 untreated group is potentially treated. As was
19 pointed out in discussions, eventually a large
20 proportion of these people are going to have
21 cataract surgery in their lifetime. The other
22 thing that we will bring up later but what I think
23 is very important is it is not the four-year risk
24 of retinal detachment, it is the 25-year risk of
25 retinal detachment.

1 DR. WEISS: So, you would like a
2 historical control of subjects with no previous
3 ocular surgery for safety but for efficacy have an
4 active control. Dr. Bradley?

5 DR. BRADLEY: I think my views on the
6 safety control group would be, again, the untreated
7 group.

8 DR. WEISS: Basically you are in agreement
9 with Dr. Ferris.

10 DR. BRADLEY: Yes, the one qualifier is
11 that there is a presumption that the literature
12 provides adequate data to support a historical
13 control, and my reading of the literature and the
14 presentations today lead me to believe that within
15 the cataract age group we have adequate data to
16 have historical literature-based controls but we
17 don't in the younger age group.

18 Again, the question is where is the
19 cut-off and I think that is perhaps for the FDA to
20 determine. Where does the literature adequately
21 provide this control?

22 DR. WEISS: Dr. Eydelman?

23 DR. EYDELMAN: If you are choosing to talk
24 about appropriate historical control being subjects
25 with no previous ocular surgery, then we have

1 adequate data in the literature for all ages.

2 DR. WEISS: Dr. Ferris?

3 DR. FERRIS: Well, just one other comment.
4 The one place where perhaps an active control group
5 would be useful for evaluating complications might
6 be in the high myopes. A side issue related to
7 what was discussed earlier is that I actually think
8 it might be a mistake not to include that group
9 because whatever happens with this study, that
10 group is going to be at excess risk of having this
11 done because they have excess benefit of having
12 this done.

13 DR. WEISS: So, basically a historical
14 control of subjects in, let's say, your routine
15 cataract if we are talking about doing a minus 3
16 presbyope where you don't really expect there to be
17 much difference from people without previous ocular
18 surgery, but if you are doing the high risk
19 patients, let's say the minus 20 myope, in that
20 case you might want an active control. If you were
21 doing a minus 20 myope, then neither of you would
22 like a historical control at that point and would
23 have an active control.

24 DR. FERRIS: It is actually in the
25 company's benefit. This is one of those places,

1 again, where you would like to have the control
2 rate because it is going to make your treated rate
3 look better because the control rate is actually
4 going to be significant. Otherwise, I am assuming
5 the control rate is close to zero.

6 DR. WEISS: It gets a little sticky from
7 the agency's standpoint--and correct me if I am
8 wrong--if we are speaking about a historical
9 control of subjects, except if we get involved in
10 certain refractive categories in which case now we
11 want to go on active control. Is there any
12 guidance you can give us on that? I guess we will
13 get involved in that when we get to question number
14 two. Dr. Brucker?

15 DR. BRUCKER: I think that we are making
16 this very complicated and unnecessary.

17 DR. WEISS: Welcome to the panel, Dr.
18 Brucker!

19 DR. BRUCKER: I have been here and I will
20 tell you we are making it complicated and it need
21 not be. It seems to me that, unlike some of the
22 comments around the table, these are patients who
23 will go elsewhere for refractive surgery. That is
24 not the case. These are patients who are perhaps
25 45-55 years of age and, like myself, they are

1 starting to have to use glasses. It is a pain in
2 the neck and it doesn't matter if they are minus 14
3 or plano like I am. The fact of the matter is that
4 these are patients that could use glasses. There
5 is no reason that this isn't a randomization trial.
6 It will make things simpler for the sponsor. It
7 will make things simpler for the patient. It will
8 make things simpler for the FDA. It makes things
9 simpler for everybody to get a group of patients
10 randomized and some will wear glasses. Okay, they
11 have done it. It is only for three more years.
12 And, some are going to have surgery. I don't see
13 what the big deal is. The end result is you are
14 going to have an idea. These patients are not
15 going to have scleral depressed peripheral
16 examinations. You are not going to know if they
17 have lattice. You are not going to know what is
18 going on in the back of their eyes. All you need
19 to do is take a look again at Ripandelli's paper.
20 Sixty percent of those patients wound up having
21 pre-treatment. It doesn't matter if they are
22 pre-treated or not. It doesn't matter what their
23 peripheral examinations are. Randomize the
24 patients. Spread it out whether they are high
25 myopes, plano emmetropes or hyperopes. Give them

1 all a chance to be in the study. Make the sample
2 size large enough. Follow them for three years and
3 you will have all of your answers and there weren't
4 be any complications or problems--let's not say
5 complications.

6 DR. WEISS: Mr. McCarley?

7 MR. MCCARLEY: I think a historical
8 cataract group would be fine unless the National
9 Eye Institute would be willing to fund and run a
10 study because it is actually the procedure we are
11 looking at, regardless of the intraocular lens.

12 DR. WEISS: I have a feeling that is not
13 forthcoming. Now we are going to go back; now that
14 we have heard everyone's opinions, some of our
15 opinions may have changed. Dr. Bressler?

16 DR. BRESSLER: I just wanted to clarify,
17 are we talking about active controls for safety or
18 efficacy? We haven't gotten to the question of
19 what is the safety that we are looking at. So, I
20 know we are in a circle and jumping in. I never
21 foresaw in suggesting active controls that you want
22 to power a study to see if there is a difference in
23 the retinal detachment rate. I mean, that is low
24 in the non-high myope population and that would
25 take 40,000 or more and it wouldn't be meaningful

1 that you reduced it from 0.01 to 0.05 or something
2 like that in percentage.

3 So, for certain safety outcomes you may
4 have to deal with historical controls and there is
5 adequate information for some of those. But for
6 other safety outcomes, for example changes in
7 visual acuity, you may be able to do it with
8 randomized controls so you don't have all the
9 confounding bias. As Rick pointed out, it is true
10 that we had 3/50 in our limited information here
11 that lost one line by six months and that could be
12 noise; it may not be noise. It may be the
13 beginning of two-line loss or three-line loss. It
14 was mainly in the hyperopes, not in the myopes in
15 that small study. That is 50 people versus--you
16 know, there are 60 million over the age of 65 that
17 are obviously going to be presbyopic.

18 So, I think it is incumbent upon the
19 safety, not the retinal detachment safety but some
20 of the others, to be aware of what these are; get
21 rid of the confounding bias and, although it may be
22 hard and take a little further discussion to get a
23 group who is willing to put this off for a few
24 years until we know what the outcome is, there are
25 enough presbyopes out there--it is not a rare

1 disease--that it may be possible. So, I just
2 wanted to add that clarification that I think I
3 agree with what most of the panel said but I am
4 still believing we would need for some of the
5 safety outcomes these controls.

6 DR. WEISS: I am going to have one comment
7 from Dr. Maguire and then I am going to ask if the
8 agency needs anything more from us on this
9 question, just because we have eight of these to
10 get through. Dr. Maguire?

11 DR. MAGUIRE: I have a question for the
12 agency. Does FDA separate groups for presbyopic
13 correction if it is reasonable to expect that one
14 of those groups is more likely to have problems
15 with safety and efficacy, specifically the high
16 myope group? That would be a reason to separate
17 them out. Is that correct?

18 DR. EYDELMAN: In any refractive
19 indication we usually break it up into the ranges
20 of refractive error. For example, for LASIK we
21 broke it up to 7 and above 7, and emmetropia would
22 probably be analyzed separately. So, yes, the data
23 would come in and then we would ask for internal
24 stratification of the data according to refractive
25 indication.

1 DR. MAGUIRE: But you would still run the
2 study as a whole? In other words, you wouldn't
3 place more stringent control requirements on
4 patients with high degrees of myopia than the
5 people with the other indications that led Dr. Lane
6 to say they shouldn't be included at all in our
7 discussion here.

8 DR. EYDELMAN: Well, it is certainly up to
9 the sponsor to design what kind of trial they want
10 to do and what inclusion criteria they want to
11 expand their design to. We would certainly take
12 your recommendations from today and try to give
13 guidance to the sponsor accordingly.

14 DR. WEISS: Dr. Rosenthal?

15 DR. ROSENTHAL: I know what Dr. Maguire is
16 getting at, and I think if there is a marked
17 discrepancy between two populations in the study
18 one would probably ask to look at both of them
19 together and then separately.

20 DR. WEISS: Dr. Smith has a quick
21 question.

22 DR. SMITH: I just wanted to clarify an
23 issue. In the first question here we are talking
24 about clear lens extraction in the correction of
25 presbyopia.

1 DR. WEISS: Yes.

2 DR. SMITH: Some of those patients may be
3 myopic, hyperopic. We are not talking about their
4 lens extraction for the treatment of high myopia.

5 DR. WEISS: We have not gone to question
6 two, that is right.

7 DR. SMITH: But this is clear lens
8 extraction and the indication is presbyopia. So,
9 that doesn't cover 25 year-olds who are minus 20.

10 DR. WEISS: You are a hundred percent
11 right.

12 DR. SMITH: So, I think that myopes are
13 complicating our discussion.

14 DR. WEISS: Well, you might have a 50
15 year-old who is minus 20 and presbyopic.

16 DR. SMITH: Right.

17 DR. WEISS: We are going to then narrow
18 things down as we go on, hopefully, but right now,
19 from what I understand, most of the panel wants
20 controls. Most of the panel is talking about
21 active controls. Some of the panel is talking
22 about historical controls for safety and active
23 controls for efficacy, and some of the panel is
24 talking about randomization. I would sort of like
25 to cut things off at this point because we have

1 eight questions and we have sort of gone over on
2 this one. Does the agency need anything else from
3 us on that particular question?

4 DR. EYDELMAN: No, thank you.

5 DR. WEISS: Fine.

6 DR. BRUCKER: Jayne--

7 DR. WEISS: Sorry--

8 DR. BRUCKER: No, no, can you answer a
9 question about something. Can somebody just tell
10 me in a sentence about the range of accommodation
11 of these multifocal intraocular lenses?

12 DR. WEISS: It is not relevant to this
13 question. We are going to get there but basically
14 I want to go in order. I mean, I can tell you the
15 crystal lens labeling I think was 1 diopter. Dr.
16 Brucker, from the PMA that was presented to the
17 panel for the crystal lens, which is the
18 accommodative IOL that has been FDA approved, the
19 labeling gave approximately 1 diopter of
20 accommodation, for your information.

21 So, question number two, should the
22 clinical study inclusion/exclusion criteria limit
23 subject enrollment based on the criteria listed
24 below? So, now what we are going to do is try to
25 address in a succinct fashion each of the criteria

1 listed and their ranges.

2 The first one is refractive error/axial
3 length. What would be the range that you would
4 want for hyperopia? Do you want to include
5 emmetropia and what is the range for myopia? Why
6 don't we start with emmetropia? Do you think that
7 a clear lens extraction trial for the correction of
8 presbyopia should include emmetropes? Dr. Brucker,
9 why don't you start on your end? Should we be
10 putting plano people in here who need 2 diopters
11 for their reading? Should they have clear lens
12 extraction?

13 DR. BRUCKER: Yes.

14 DR. WEISS: Yes. Dr. Ferris?

15 DR. FERRIS: I apologize for this but I
16 think it is going to take forever if we go through
17 all of these. I think that what ought to be
18 included is what is likely to be included in
19 practice. So, if people are going in practice to
20 include myopia, it needs to be in there. If they
21 are going to include hyperopia, it needs to be in
22 there. Are there extreme levels where you would
23 want to exclude them? Yes, and I think that is the
24 grey zone and we have to talk about that.

25 DR. WEISS: Actually, I think your point

1 is well taken. When we are going around, I am
2 going to change sort of the question to you. Why
3 don't you give me the refractive range that you
4 would like? You don't have to say from this range
5 to this range; you can stop around emmetropia or
6 low myopia or low amounts of hyperopia if you would
7 like. Some might want it to be only on the whole
8 range. One example would be from plus 10 to minus
9 20. Another example would be that you might think
10 it would be indicated from plus 6 to plus 10 and
11 from minus 6 to minus 20 and not have the low
12 myopes, the low hyperopes and the emmetropes. We
13 can go about it that way. I think that is sort of
14 addressing what you are saying. I understand there
15 is a grey zone but where would you put the
16 limitations?

17 DR. FERRIS: Right, so "I'll see you and
18 raise you one."

19 [Laughter]

20 I think that I would exclude extreme
21 hyperopia and extreme myopia but I would leave the
22 definitions of that probably to the company, but I
23 would want to include certainly to minus 10 and
24 probably to plus 5, and I would be flexible on more
25 and less--well, I am not sure I would be too

1 flexible on less. Where I am going to raise one is
2 I think for moderate myopia, let's say over minus
3 4, I would like to power the study high enough so
4 that you could say something specifically about
5 myopia separately from emmetropia and hyperopia.

6 DR. WEISS: Well, I am going to ask for
7 either abstentions or numbers because I think what
8 the FDA really wants from us is numbers. That is
9 why they are coming to us. From what I understand,
10 you are saying from minus 4 to minus 10 in terms of
11 the myopic range.

12 DR. FERRIS: I would like to power it so I
13 could look at least at that range separately, and I
14 would include, and I think this is totally
15 arbitrary, but plus 5 to minus 14.

16 DR. WEISS: So, you are saying plus 5 to
17 minus 14 and you would be including emmetropes.

18 DR. FERRIS: Absolutely.

19 DR. WEISS: So, you would be including
20 plus 1's and minus 1's in that.

21 DR. FERRIS: Well, this is all about
22 presbyopia, isn't it? Ask Dr. Brucker whether he
23 is happy with his presbyopia.

24 DR. WEISS: Dr. Brucker, we won't to ask
25 if you are happy with your presbyopia, but plus 5

1 to minus 14--

2 DR. BRUCKER: I am not happy with my
3 presbyopia--

4 DR. WEISS: Okay, it is an aside and it
5 will be on transcript for evermore. But what are
6 your numbers, again? Plus 5 to minus 14 including
7 those with your refractive error?

8 DR. BRUCKER: Yes, I would just say that
9 you might want to look statistically. I wouldn't
10 hold it exactly to where that minus 14 is if the
11 numbers are so small that it isn't worth it. You
12 must be minus 12 or minus 15, somewhere in that
13 range is okay because the numbers get so small that
14 it doesn't matter anyway. In other words, I think
15 a minus 20 myope should be excluded but whether it
16 be minus 12 or minus 14 from the standpoint of the
17 FDA or the sponsor really doesn't matter to me. Do
18 you understand?

19 DR. WEISS: Dr. Eydelman?

20 DR. EYDELMAN: No, I don't because what we
21 are talking about is inclusion criteria--

22 DR. BRUCKER: Correct.

23 DR. EYDELMAN: --we are not talking about
24 determination of sample size. Right now we are
25 just trying to figure out for whom the risk/benefit

1 is such that it warrants inclusion.

2 DR. BRUCKER: Make is simple, make it
3 minus 14.

4 DR. WEISS: Dr. Bradley?

5 DR. BRADLEY: You are not going to like
6 me. It seems that you are asking us the wrong
7 question, if you don't mind me asserting that. You
8 are asking us to identify a refractive range and
9 age range for which the risk/benefit is acceptable.
10 It seems to me the question should be what is the
11 risk/benefit that is acceptable and then we will
12 determine the refractive range. We have not
13 identified the risk/benefit that we find
14 acceptable.

15 DR. EYDELMAN: Unfortunately, from the
16 design of the study we will first have to decide
17 who we study before we give you the answer.

18 DR. BRADLEY: Well, I think the
19 presentation this morning was trying to educate us
20 on the risks, in particular retinal detachment,
21 associated with lens extraction. If we have a
22 sense of what that risk is and we can say what is
23 an acceptable risk--is it 1 percent? Is it 0.1
24 percent? Once we have that acceptable risk, then
25 the data will tell you what the acceptable

1 refractive range is; what the acceptable age range
2 is. For us to do that in our head and come up with
3 an acceptable refractive range and acceptable age
4 range, quite frankly, is impossible. Therefore, I
5 abstain.

6 DR. WEISS: Okay, so we have an
7 abstention. See, I do like you, Dr. Bradley. Dr.
8 McMahon?

9 DR. MCMAHON: All presbyopia short of
10 nanophthalmos, up to minus 10.

11 DR. WEISS: Can you repeat that? For
12 hyperopia you don't want those who are
13 nanophthalmic?

14 DR. MCMAHON: Correct.

15 DR. WEISS: That is good.

16 DR. MCMAHON: Basically, that is about
17 plus 8.

18 DR. WEISS: So, you would extend the level
19 of hyperopia to just short of someone who has
20 something pathologic and is going to get a
21 devastating complication. And for myopia?

22 DR. MCMAHON: Minus 10.

23 DR. WEISS: Minus 10, and you would also
24 include emmetropes?

25 DR. MCMAHON: Yes.

1 DR. WEISS: Uncharacteristically, I will
2 abstain. Dr. Grimmer?

3 DR. GRIMMETT: I am less concerned about
4 the range of hyperopia, albeit from a cataract
5 surgeon's perspective it is difficult. You don't
6 have enough interior chamber depth to do the
7 surgery in high hyperopes through the shallow ACs.
8 But I am in agreement with Dr. McMahon's comment
9 that short of nanophthalmos I am not really too
10 concerned about the level of hyperopia.

11 Myopia, I am a little cautious here due to
12 the fact that these are performed on younger age
13 patients and we saw this morning that high myopes
14 have an increasing rate of retinal detachment that
15 looked almost like an exponential function the
16 longer you followed them out. I am up to minus 8
17 on the myopia.

18 DR. WEISS: And you would also include
19 emmetropes?

20 DR. GRIMMETT: True.

21 DR. WEISS: I would ask the panel one
22 question, if you have someone who is, let's say,
23 plano and they have a decent chance of having the
24 glare and halos and they are going to achieve a J3
25 or J5 with the risk of lens extraction, do you want

1 to include emmetropes? I am going to continue
2 along and I know you have a comment on that, Dr.
3 Bressler, but we will start with Dr. Mathers and
4 continue along. Dr. Mathers?

5 DR. MATHERS: Well, I think it is a real
6 ethical question about what we are recommending
7 because as a scientist and a physician I would
8 really like to know this data but I am very
9 concerned about the relative risk of doing these
10 clear lens extractions on relatively young people,
11 particularly in their 40s or maybe even younger. I
12 think that is going to get more difficult in the
13 hyperopic group that are going to be pushing to
14 have their surgery earlier.

15 But because this is being done now, I
16 think it is imperative that we really find out, and
17 I think that actually it is worth the risk of
18 having a couple of hundred people be in this group
19 to get us information even if there is an ethical
20 question. I think we will solve the larger ethical
21 question. And, I think there will be people who
22 are willing to undergo that risk, a few people, and
23 it won't take that many. But I think that we
24 should be careful about extending the age range
25 down too far. I can't tell you exactly what this

1 is but I am sure that we need the information in
2 the younger age group but I would just be cautious
3 about extending it down so I would go for hyperopic
4 patients fairly high up to about a minus 10, minus
5 12.

6 DR. ROSENTHAL: Could I just comment on
7 something? DR. WEISS: Dr.
8 Rosenthal?

9 DR. ROSENTHAL: The patients can't be too
10 young because they are going to have to have some
11 accommodative loss, which is number C). So, I
12 don't think a 20 year-old myope with minus 20 is
13 going to fit into that inclusion criteria.

14 DR. MATHERS: But a 30 year-old with a
15 plus 5 would be knocking on your door.

16 DR. WEISS: Not necessarily, and I think
17 we are going to get to that because we have
18 criteria for degree of accommodative loss. Your
19 level for hyperopia was--a number?

20 DR. MATHERS: Seven.

21 DR. WEISS: Seven. Dr. Ho?

22 DR. HO: I think Dr. Smith addressed this
23 issue earlier where things start to begin to get a
24 little less than grey. But to answer this
25 question, I think, first of all, the notion of

1 active and separate historical controls is
2 appealing and is a little different than what I
3 described earlier. I think with respect to a range
4 of accommodative refractive error I would be
5 comfortable with anything that is non-pathologic on
6 the hyperopic side. I am a little more protective
7 on the myopic side, for this study design that you
8 are describing, to minus 6.

9 DR. WEISS: Give me a number for
10 hyperopia, if you would.

11 DR. HO: Plus 8.

12 DR. WEISS: Dr. Smith?

13 DR. SMITH: Plus 8 to minus 10, including
14 emmetropes.

15 DR. WEISS: Dr. Bressler?

16 DR. BRESSLER: I am going to give you a
17 number but you may not like it. I agree that we
18 need to find out what is going on in the majority
19 of the population that this may be appealing to,
20 and I would like to say there is good data on what
21 the refractive errors are, for example, in the
22 United States and I would go with 95 percent of
23 what the refractive errors are out there and
24 exclude the extremes on either end. We can look up
25 that number. I don't have it with me but the 95

1 percent is the number I want to use and I don't
2 know if it is minus 8, minus 5, minus 6.

3 Then, I would add to the FDA's advice that
4 there be a corollary to whatever this number range
5 becomes to add to it something that many have
6 alluded to, and that is if there are pathologic
7 features that are normally associated with those
8 extremes. So, we have people who are minus 3 every
9 now and then but, because of the way their cornea
10 and lens are, they are actually myopic and you can
11 see the myopic changes. The same is true with the
12 hyperopes. So, as you have your inclusion criteria
13 for this, add something that includes those sorts
14 of pathologic appearances.

15 DR. WEISS: And I think that would address
16 2 E) on this list for are there any other criteria.
17 Thank you. Dr. Brown?

18 DR. BROWN: My concern is that regardless
19 of how restrictive we make the study, the procedure
20 will be done on anyone essentially and that is my
21 concern. So, I don't want to be too restrictive
22 and I would go along with Neil's recommendation of
23 a 95 percent interval in the population, and I also
24 think it will provide important data. The rate may
25 be lower than we are expecting in that minus 6 to

1 minus 10. So, I think that I would go that way and
2 be more inclusive for this study.

3 DR. WEISS: Dr. Stark?

4 DR. STARK: It was interesting to me that
5 Dr. Lane's presentation from the company would
6 restrict it to low myopes and low hyperopes just
7 for presbyopia, and it would exclude all the
8 pathologic cases. That may get them through
9 earlier or sooner with less complications. But
10 once it is approved, then it is going to be
11 promoted as lens removal or lens exchange. So, I
12 think we should have the range that will show us
13 what the moderately high hyperopes and myopes do
14 and if there are any potential complications. For
15 example, myopes have larger eyes. A 4 mm optic in
16 that myopic eye, that larger eye, larger pupil
17 sometimes, may cause significant problems with
18 nighttime vision. So, I would say in the range of
19 a minimum of plus 6 to 10-12.

20 But also, we need to correlate that with
21 axial length. I think Neil addressed the issue.
22 Some of these people have a very flat cornea but an
23 extremely long eye and are lower myopes but, in
24 fact, they may have a 28 mm axial length. So, we
25 may want to tie into this refractive range a

1 certain axial length. Certainly, an axial length
2 of less than 18 is a nanophthalmic eye and it would
3 depend on the cornea what the refractive error was.
4 An axial length greater than 28 mm or 29 mm is one
5 that is subject to a lot more potential for
6 problems. So, we need to put that in with the
7 refractive error.

8 DR. WEISS: Dr. Eydelman actually has
9 included that in this portion of the questions.
10 So, as long as you are bringing it up, Dr. Stark,
11 do you want to exclude patients with an axial
12 length greater than 28 or 29 and less than 18?

13 DR. STARK: Well, I would tend to include
14 them but you may find your analysis of retinal
15 complications in the high myopic population is more
16 related not exactly to what the preoperative myopia
17 was but what the preoperative axial length was.
18 That is the important information for them, and
19 also in the controls we would have to do axial
20 length measurements.

21 DR. WEISS: You want axial length to be
22 known in addition to the level of myopia or
23 hyperopia but you would not be excluding people on
24 axial length by itself.

25 DR. STARK: Well, I certainly would

1 exclude the hyperopes less than 18.

2 DR. WEISS: So, less than 18 would be the
3 exclusionary criteria.

4 DR. STARK: And maybe less than 20. But
5 we would have to correlate that with the
6 refraction.

7 DR. WEISS: Would you have an upper limit
8 of axial length for the high myopes or not?

9 DR. STARK: Probably 28.

10 DR. WEISS: So, 18 to 28 would be the
11 range that you would want to be including in the
12 study. Dr. Maguire?

13 DR. MAGUIRE: I agree with everything that
14 has been said from the standpoint that we know
15 there is a slippery slope on increased
16 complications when you get to the very high myopes
17 and the very high hyperopes. I have the same
18 distaste for the idea of operating on emmetropes to
19 correct presbyopia given the obvious public health
20 issues that are here. But, you know, we have
21 crossed the Rubicon already so we have to do this.

22 I also have a question for FDA. It seemed
23 to me that at the last ocular lens panel discussion
24 we had for guidance in the past, we were informed
25 that there were monofocal IOL studies for low

1 myopia going on already. Isn't that correct? Down
2 to like minus 2 or something?

3 DR. ROSENTHAL: Phakic IOL.

4 DR. MAGUIRE: Oh, that as phakic IOLs.
5 Still, a phakic IOL is down to minus 3. So, we
6 have crossed the Rubicon. We just have to get the
7 information so we can not be in the type of problem
8 we are now where we don't have information and FDA
9 can't say anything.

10 DR. WEISS: Dr. Ferris?

11 DR. FERRIS: I just want to make a quick
12 comment, and I rarely disagree with Dr. Bressler
13 but the thing I worry about here is that we are
14 dancing around what I think is the crux of this
15 issue and that is informed consent. I think that
16 we all have different risk/benefit internal ratios
17 and the Hamlets shouldn't tell the Admiral
18 Farraguts what to do, but I worry that if there is
19 a special group that is at extra risk of having
20 this done and is at extra risk of having
21 complications, we need to have something to tell
22 them about that extra risk because they are going
23 to be told about the extra benefits--

24 DR. WEISS: I mean, we can just sort of
25 add that to e) here, that those people who are at

1 more risk, they should have a little more detailed
2 informed consent.

3 DR. WILLIAMS:

4 DR. EYDELMAN: That would be routine under
5 the IDE procedures.

6 DR. WEISS: Dr. Rosenthal?

7 DR. ROSENTHAL: No, I don't think that is
8 what Dr. Ferris is getting at. He was getting at
9 to include people at the extremes so that you can
10 provide--

11 DR. FERRIS: Yes, if you don't have them
12 you can't tell them what their extra risk is, and
13 if you tell them what the risk in the study
14 is--here is this minus 15 and you tell them we did
15 this study and there wasn't any problem, that may
16 be the wrong thing to tell them. That is why I
17 said you need to power it enough so that you have
18 some reasonably high myopes because they are at
19 extra risk. Unless you are going to say absolutely
20 never are you going to do this in high myopes, and
21 we already know that is stupid because it is
22 happening right now.

23 DR. WEISS: Just to play devil's advocate,
24 I would say why limit it to minus 14?

25 DR. FERRIS: I wouldn't limit it at all.

1 But probably the truth is--what Neil was getting at
2 I think, once you get above minus 14, and I don't
3 know where the number is, you are going to have so
4 few of them that you are not going to be able to
5 really give good risk estimates. You are just not
6 going to have them.

7 DR. WEISS: We need to sort of end this
8 portion of it because we are really taking too
9 long. From what I have heard from panel members,
10 the high amount of hyperopia that has been
11 suggested is to go up to plus 8, and it sort of
12 varied between plus 5 and plus 8 but everyone has
13 had the same sentiment that we want to avoid any
14 patients who might have any indication that they
15 could have nanophthalmos.

16 There has been consensus essentially on
17 doing the emmetropes, the low myopes and the low
18 hyperopes. There has not been anyone who has been
19 against that. Then, in terms of the higher level
20 of myopia, it had been expressed between minus 6
21 and minus 14 by various members of the panel but
22 now I am hearing, Dr. Ferris, that you might go
23 even higher if those people could be recruited
24 because even if they had a higher adverse reaction
25 that is something you would want to get into the

1 literature.

2 DR. FERRIS: Sure, and if I was advising
3 the company I would tell them don't put those minus
4 20s in here. So, I am advising the FDA that I
5 would like to see all the data I can have but I can
6 understand, if I was doing this study, I would like
7 to say, you know, these people are at special risk
8 and I am going to tell them they are at special
9 risk and I don't even want to include them in the
10 study.

11 DR. WEISS: Dr. Brucker?

12 DR. BRUCKER: Yes, my point when I was cut
13 off which you now have accepted, which I do not
14 appreciate, is the fact that if you go from a minus
15 14 to a minus, let's say, 28 and let's say you have
16 2 patients in every half step category, you may
17 wind up having 20 or 30 patients in this range of
18 minus 14 to minus 28 and not be able to analyze
19 them because they are spread out so thin and that
20 is such a rare population of patients.

21 My inference to you was look at the
22 general population--Neil was saying 95
23 percent--take a look at the general population.
24 Don't get yourself screwed up by having one patient
25 in each of these half diopter refractions and not

1 be able to analyze them. Power adequately so that
2 you have all of the bases covered, but make sure
3 that you don't get yourself tilted on this last
4 five percent, as Neil was saying, so you that can't
5 answer any questions. That was my inference.

6 DR. WEISS: In addition to what I was just
7 mentioning in terms of the range, there were two
8 members of the panel who would prefer to look at
9 the 95 percent. Do you have any idea what we would
10 be talking about with a 95 percent refractive
11 range?

12 DR. EYDELMAN: It would be much lower. It
13 is definitely under 7 because we looked at it--

14 DR. WEISS: Myopia?

15 DR. EYDELMAN: Myopia. I don't have the
16 numbers in front of me but I would venture to say
17 somewhere around 4 or 5 diopters. I mean, it is
18 pretty low.

19 DR. WEISS: Then, Dr. Bressler, if it only
20 went up to minus 4 or minus 5 would you change your
21 mind on wanting 95 percent? Of course, many of the
22 patients who are going to want this are those with
23 higher amounts of myopia and we won't have the
24 information, which is sort of what Dr. Ferris was
25 alluding to.

1 DR. BRESSLER: Yes, a little bit but not
2 completely to what Rick said. So, you know, maybe
3 go to 97.5 percent. But I am concerned about
4 having any studies done on minus 15 or minus 20 or
5 minus 24 at this time even to get the information
6 because I think I already know the information,
7 that there is a much, much higher risk of retinal
8 detachment that far outweighs any immediate benefit
9 I can see in terms of their gaining no reading
10 glasses for presbyopia. We are talking about
11 presbyopia, not their refractive error for
12 distance. So, I am not ready to open the flood
13 gates to it. I want enough of the minus 4's, 5's,
14 6's, 7's, 8's because they will be different
15 perhaps from the minus 2's.

16 DR. WEISS: We will have one comment from
17 Dr. Ferris, and then we are just going to sort of
18 briefly go through the axial length because I think
19 this is just basically a personal viewpoint which
20 you can agree to disagree in terms of whether you
21 want to have the data to document the higher risk,
22 or whether your concern is with the individual
23 patient and you don't want them being the one to
24 get the retinal detachment and prove what you
25 suspect might be occurring in any case. Dr.

1 Ferris?

2 DR. FERRIS: Just a quick comment, and
3 that is that although I understood this comment
4 about staging this and we will do the safe ones
5 first and then we will do the risky ones next, I
6 think the reality is that we have one shot at this,
7 that there is not going to be the second study and
8 maybe you can do post-marketing studies but I would
9 like to review the history of how effective those
10 are. So, I think there is probably one shot at
11 getting this information.

12 DR. WEISS: Dr. Stark had suggested an
13 axial length range inclusion from approximately 18
14 or 20 to 28 or 29. Would anyone from the panel
15 disagree with that?

16 DR. STARK: I would probably go to 20; 18
17 really--

18 DR. WEISS: Is pushing it. So, we will
19 change that from 20 to 28, 29. Dr. Grimmer?

20 DR. GRIMMETT: What is the old rule, 3
21 diopters per millimeter, or something like that,
22 different from 24 mm as average? I am a little
23 worried about the upper range. Probably around 27
24 or so, which would be about minus 9 I guess if you
25 use the average rule of thumb, and then I would

1 probably do the same on the plus side, something
2 like that.

3 DR. WEISS: Is that enough information for
4 the agency on that one?

5 DR. EYDELMAN: Yes, thank you.

6 DR. WEISS: We are running late already.
7 It is early but we are running late. So, we are
8 going to go to b) and see how quickly that goes.
9 We are going to break for lunch in a little bit but
10 we are going to delay that just a tad.

11 Patient age, does anyone from the panel
12 want to suggest a range? By the way, we don't have
13 to limit any of these criteria so you could say you
14 don't want to limit patient age but these are
15 things that, if you do want to limit them, what
16 would you like the range to be? And, if you don't
17 want to limit them, we will hear from you. I am
18 not going to go around on this one. I am just
19 going to ask someone from the panel to propose if
20 they want to limit age, and if they do, what they
21 want to limit it to. Dr. Ferris?

22 DR. FERRIS: For me, I would go to C). If
23 we are talking about presbyopia I don't care how
24 old they are.

25 DR. BRESSLER: I concur. I don't want age

1 discrimination. It really depends on how the
2 person presents. You could have a 35 year-old who
3 happens to have what we are thinking of as the 50
4 year-old eye.

5 DR. WEISS: So, would anyone from the
6 panel disagree with that? Dr. Mathers?

7 DR. MATHERS: But I thought that the issue
8 of changing the vitreous face and retinal
9 detachment predisposition increases as you come
10 into the younger age group. So, I think age, in
11 and of itself, is a relevant factor and if we are
12 not careful we are going to be operating on mid-30s
13 and the retinal detachment rate may be much
14 different than in the 50 or 60 year-old group.

15 DR. WEISS: And you might operate on a
16 mid-30s and that might be the one with the minus 15
17 or minus 12 or minus 10.

18 DR. MATHERS: Right. So, I would be more
19 in favor of limiting it to, say, 45; maybe 40 but
20 not less than that.

21 DR. WEISS: Is there any disagreement with
22 that? Does anyone have a problem with limiting?
23 Would you want to suggest 40 or 45?

24 DR. MATHERS: Well, ethically? We might
25 as well get the data; let's go to 40.

1 DR. WEISS: So, we have a suggestion of a
2 lower age limit of 40. Does anyone disagree with
3 that?

4 DR. MCMAHON: I do.

5 DR. WEISS: Dr. McMahon?

6 DR. MCMAHON: The median age of patients
7 coming in with enough symptomatic complaints for
8 presbyopic correction is 44 so I would set the
9 limit at 45. That way you would have reasonable
10 certainty the patient has presbyopic symptoms.

11 DR. WEISS: Does anyone have any strong
12 feeling that it should be less than 45? Dr.
13 Mathers?

14 DR. MATHERS: The hyperopic group is going
15 to be extremely, say, attractive for this procedure
16 and we are not going to know how they are going to
17 do. They are going to want this at 40 and I think
18 we should find out because we have a chance here
19 to find out. If we don't go to 40 now we are not
20 going to go.

21 DR. WEISS: Dr. McMahon, does that change
22 your opinion or no?

23 DR. MCMAHON: Dr. Mathers has a very good
24 point and I balance that median age for presbyopic
25 symptoms keeping in mind that presbyopes, many of

1 which go around uncorrected if they are relatively
2 low presbyopes, come in with their symptoms
3 earlier. At the same time, you raise the issue
4 with regard to vitreous face issues and so forth,
5 so I would still argue for 45.

6 DR. WEISS: Do you need anything more?
7 No? That is fine. Dare we go to degree of
8 accommodative loss? I see glucose levels dropping
9 as I bring that one up, and preoperative
10 endothelial cell count, after the last two panel
11 meetings, my glucose level with drop on that one
12 too. So, it is 12:10. We are going to be back
13 here in one hours. Dr. Ferris?

14 DR. FERRIS: I am curious. Are we not
15 looking at degree of accommodative loss because we
16 can't measure it?

17 DR. WEISS: No, no, no. That was just a
18 slight bit of poor humor. I assume that is going
19 to take us more than three minutes to get through,
20 unless anyone has the answer. Seeing no answer, we
21 will break for lunch.

22 [Whereupon, at 12:10 p.m., the proceedings
23 were recessed for lunch, to resume at 1:10
24 p.m.]

1 A F T E R N O O N P R O C E E D I N G S

2 DR. WEISS: We are now going to continue
3 with panel deliberations. We are going to be
4 changing the format somewhat in terms of trying to
5 pare things down to get through these questions at
6 a more rapid pace. So, I am not going to be going
7 around polling anyone anymore. We are just going
8 to basically throw the question out. If someone
9 has a relevant comment, and I emphasize relevant,
10 then please address it. We will be getting
11 basically to all of the important questions but it
12 serves the agency's purposes much better if we
13 discuss the issue at hand when the issue at hand is
14 in front of us.

15 So, we are going to now go on to 2 c),
16 degree of accommodative loss. Does anyone on the
17 panel have a comment as to whether the clinical
18 study inclusion/exclusion criteria should limit
19 subject enrollment on degree of accommodative loss
20 and, if you think it should limit it on degree of
21 accommodative loss, based on what type of
22 measurement of accommodative loss? Does anyone
23 have a comment directed to this? Dr. Bradley?

24 DR. BRADLEY: It seems to me that if the
25 device that is to be studied has the potential to

1 provide a large degree of either accommodation or
2 what has been characterized as
3 pseudo-accommodation, which means without actual
4 power change effective near vision is provided,
5 then I would think the inclusion criteria would
6 stretch to earlier ages and higher levels of
7 residual accommodation. If the device only has a
8 very limited accommodative range or limited amount
9 of pseudo-accommodation, it would seem reasonable
10 to limit the device to those who have only small
11 amounts of residual accommodation.

12 DR. WEISS: Was that a definite maybe?

13 DR. BRADLEY: It means you can't have a
14 single answer for every product. I mean, one
15 answer doesn't fit all. It depends on how
16 effective the product is going to be. The idea is
17 if you have a lens that can produce half a diopter
18 of accommodation it doesn't make a lot of sense to
19 remove natural lenses that have 2 diopters of
20 residual accommodation and replace it with a half
21 diopter accommodating lens. Whereas, if the new
22 lens has 4 diopters of accommodation, it makes a
23 lot of sense to take out the 2 diopter residual
24 accommodative natural lens and replace it with an
25 IOL that gives 4 diopters. Does that make sense?

1 DR. WEISS: Is that good enough for the
2 agency? Do you need more discussion on that? Dr.
3 Eydelman?

4 DR. EYDELMAN: Yes, multifocal IOLs don't
5 particularly have an accommodative range; they have
6 a near visual acuity correction in a certain
7 percentage of patients. None of the standards or
8 guidances particularly cull out the accommodative
9 loss prior to MIOL enrollment because obviously, we
10 are treating cataracts. So, that would not
11 necessarily be applicable for MIOL replacement.

12 DR. WEISS: Dr. Bradley?

13 DR. BRADLEY: Yes, that brings us to the
14 pseudo-accommodation issue. I think it would seem
15 reasonable to me for the sponsor to have to
16 convince the FDA. If they want to expand the range
17 of patients to include those with larger amounts of
18 residual accommodation, they would have to present
19 the FDA with some sort of argument that these
20 patients would actually benefit by this new lens.
21 Does that make sense? For example, if you have a
22 patient with 2 diopters of residual accommodation,
23 arguably they can focus at 50 cm perfectly well.
24 It seems to me the sponsor would have to convince
25 the FDA to include those patients by suggesting

1 that with the new lens they would be able to see at
2 closer distances than 50 cm, more than they would
3 with their original lens.

4 DR. WEISS: Dr. Brucker?

5 DR. BRUCKER: The issue was brought up by
6 Walter or Dr. Mathers. If you have a patient who
7 is going to be in the younger age group and is a
8 hyperope and they still have some accommodative
9 power left, they may be able to see J1 at 14 in.
10 That is wonderful. But if they have lost
11 everything else they are going to be coming around
12 and saying, "wait, I used to be able to see
13 everything on the table in front of me. I couldn't
14 see up close but I could see everything on the
15 table," and now you have taken their lens out. So,
16 the question that he is raising is if you don't
17 have an accommodative range, it is fine, take the
18 lens out; put an IOL in their eye and it is not a
19 problem. But if a patient has 2 diopters of
20 accommodation left in their eye and they are 38
21 years of age or 41 years of age, is it appropriate
22 to sacrifice that accommodative power because you
23 are going to give them 14 in of no glasses up
24 front? It may not be. And, that needs to be
25 considered in the indications, the labeling, etc.

1 There may not be enough risk/benefit; there may not
2 be a ratio that is worthwhile. If you still have
3 all that accommodation the risks aren't worth it.
4 If you are 55 or 60 years of age and, sure, you
5 can't see anything on the table in front of you,
6 put the IOL in their eye.

7 DR. WEISS: Dr. Mathers?

8 DR. MATHERS: Regardless of what the
9 accommodation is at the time of surgery, in a
10 fairly short period of time they are going to lose
11 a lot of that accommodation anyway. It may be that
12 the efficacy is actually going to be better in
13 hyperopes who still have accommodative levels
14 intact because their ciliary body still acts better
15 than for someone who has lost it and it would be
16 interesting to find that out. So, I don't think
17 that we should limit the entrance criteria but we
18 should put in a reasonable effort in measuring
19 afterwards to find out how efficacious it is in
20 which group and for how long.

21 DR. ROSENTHAL: Excuse me--

22 DR. WEISS: Dr. Rosenthal?

23 DR. ROSENTHAL: It is rather difficult.
24 They are going to have near visual acuity that can
25 be measured. They are going to require plus 2 to

1 read J1 or plus 1.5 to read J1. Maybe we should
2 take it from that viewpoint rather than from
3 accommodative loss. What should we be including in
4 the study? Shall we allow the sponsor to operate
5 and implant a lens in someone who can read J2 with
6 a plus 0.50?

7 DR. WEISS: Dr. Ferris?

8 DR. FERRIS: Well, one might ask how dumb
9 the company is going to be to include those
10 patients because, at the end of the day, they are
11 going to have a lot more risk with including them.
12 So, surely you would want to include people who are
13 having trouble if your outcome is going to be that
14 you have to show improvement.

15 DR. ROSENTHAL: What is trouble?

16 DR. FERRIS: Well, I agree with what I
17 think you were saying, that you would like to say
18 that they can read at some level and the world is
19 grey. My world is grey and you can pick the level
20 but I would think that these are people that can't
21 read J2. I don't care what you pick but you had
22 better be able to show that you have at least done
23 them a favor by doing this surgery which is surely
24 putting them at risk.

25 DR. WEISS: Dr. Maguire?

1 DR. MAGUIRE: I think this morning Dr.
2 Mathers said that we only get one shot at this and
3 we should have our age limit relatively low because
4 of that. He picked 40. He picked that because he
5 wants to get at a critical safety issue, which is
6 retinal detachment in young patients. I think we
7 should just leave the degree of accommodative loss
8 alone and cast a wide net because one of the
9 outcomes might be that people with relatively
10 minimal loss have decreased quality of life after
11 the lens and that is something we need to know, if
12 that stratifies by age. So, I don't think there
13 should be an exclusion criteria based on degree of
14 accommodative loss.

15 DR. WEISS: I would voice the opposite
16 opinion because this is for correction specifically
17 of presbyopia. I think we get to a slipperier
18 slope if we have no criteria for accommodative
19 loss. I would like to see that someone, indeed,
20 required a plus 1.50 for near or plus 2 for near.
21 Otherwise, why is this lens being used for
22 presbyopia? Dr. Maguire?

23 DR. MAGUIRE: I respect that outcome but I
24 would also respectfully submit that you are
25 thinking in terms of simple spherocylindrical

1 optics and a lot of these lenses that we are going
2 to see are going to give people simultaneously good
3 distance and near vision because they work on the
4 concept of increasing depth of field, and any lens
5 that gives you vision through increasing depth of
6 field pays the price of optical degradation to do
7 it. We know that already because of the subjective
8 complaints of these people. They all complain of
9 halos. We know the optics are not that good but
10 they form a positive opinion despite that in about
11 92-95 percent of the patients. So, I think you
12 just have to let that go. I think you have to go
13 with the low age group and not bring accommodation
14 into it because we are on a lot of different
15 simultaneous slipper slopes that counteract. I
16 think we get one shot and we have to look at that.

17 DR. WEISS: Any other opinions on this
18 issue? Dr. Ferris, Dr. Bradley and then I am going
19 to ask you if you have enough information on this.
20 Dr. Ferris?

21 DR. FERRIS: I actually think we are going
22 to have to get to this when we start talking about
23 efficacy and how we are going to measure it. That
24 is going to determine what level of accommodative
25 loss or what reading level you have because if you

1 are at the ceiling you are never going to be able
2 to show improvement, if you understand what I mean
3 by that. So, some of these other things that are
4 down the road may come back to this.

5 DR. WEISS: So, you would like to show
6 some degree of accommodative loss preoperatively.

7 DR. FERRIS: If you are testing presbyopia
8 I would like to show that you have done something
9 about it, yes.

10 DR. WEISS: Dr. Bradley?

11 DR. BRADLEY: It is worth reminding
12 ourselves that presbyopia is really two different
13 creatures. In some sense we stop presbyopia in
14 young adulthood but we only turn up at the clinic
15 when we can no longer read. Accommodation is
16 declining throughout our life. In some ways this
17 study will be self-selecting. I mean, patients who
18 are manifesting problems with their presbyopia, and
19 it may be that they are down to 2 diopters of
20 accommodation; it may be that they are 1 diopter
21 hyperope and they are down to 3 diopters of
22 accommodation. So, that may vary. The actual
23 amount of accommodation may vary at the time the
24 patient presents with problems with presbyopia.
25 So, in some ways you might must let the patient

1 self-select this. They are seeing their clinician
2 because they have a problem with presbyopia. Maybe
3 that is the patient base you should use.

4 DR. WEISS: It appears that we have no
5 consensus on this one. Is that sufficient for the
6 agency?

7 DR. EYDELMAN: I guess it will have to do.

8 DR. ROSENTHAL: Actually, we have a
9 consensus--

10 DR. WEISS: We have a consensus of one.
11 Dr. Rosenthal?

12 DR. ROSENTHAL: --that is that if they
13 have to have reading glasses for what we would
14 consider a reasonable amount of dioptric power and
15 the lens can achieve a better dioptric power at
16 near, then I think it is reasonable. But I don't
17 want to give someone who has plus 2.5 to read The
18 Wall Street Journal--you know, I think that is
19 putting people maybe at undue risk but I think we
20 have a sense where we can go with that.

21 DR. WEISS: Dr. Stark?

22 DR. STARK: Well, you need to leave a
23 little of your accommodative power in reserve so I
24 would say that the need for reading glasses or
25 bifocals and no more than 3 diopters of

1 accommodative reserve, and it could be no more than
2 2 diopters or no more than 4, but if you say 4
3 diopters, then in general people can get by with
4 that and read. So, they are not just doing clear
5 lens extraction and then throwing in a bifocal with
6 it; it is for presbyopia.

7 DR. WEISS: Dr. Mathers, and then I think
8 we will be concluding this.

9 DR. MATHERS: This is very much a moving
10 target. It is a dynamic process when you are
11 talking about what someone's accommodation is in
12 January, the same year in December it is going to
13 be less. In two years, by the end of the study, in
14 two or three years, it is definitely going to be
15 less. So, I don't think it is critical how you get
16 in because we are all going to be there anyway and
17 we need to spread a broad net.

18 DR. WEISS: Well, at least in my opinion,
19 I am in agreement with Walter and Ralph, that we
20 should have some documentation of some degree of
21 accommodative loss in terms of needing a bifocal or
22 accommodative reserve so you have something to
23 compare it to as far as the success of this
24 procedure. But we have, obviously, a mixture of
25 opinions up here. So, if that is fine with the

1 agency we can go on. Is that okay?

2 DR. EYDELMAN: I just wanted to say
3 something about clarification regarding what Dr.
4 Ferris said. Obviously, when you are discussing
5 efficacy criteria you will have to take that into
6 consideration but normally the way we do the
7 studies, it is not each individual subject's
8 improvement.

9 DR. WEISS: Dr. Ferris?

10 DR. FERRIS: If you enroll people who
11 don't need anything to read J1 how are you going to
12 show that this treatment was effective? You can't
13 show improvement if you have no place to go. It
14 would be incredibly dumb for a company to do that
15 because they are going to have some proportion of
16 patients who didn't improve. Well, they didn't
17 improve because they couldn't improve. Maybe they
18 did improve. Maybe they could read J0.5 but we
19 don't even have that. So, it would be silly to put
20 people into a trial if the outcome--for example in
21 some trial if 3 lines visual gain, it would be dumb
22 to put 20/20 people in because they are not going
23 to get 3 lines visual gain no matter how good your
24 treatment is, or let's say 20/15. That was my
25 point about the ceiling, that usually your

1 eligibility criteria are such that if your outcome
2 is a certain level of visual improvement and that
3 is at least possible to attain, otherwise you have
4 a bunch of people who are going to be negative even
5 if you conceivably help them.

6 DR. EYDELMAN: So, if I can just
7 paraphrase what you are saying, you recommended in
8 lieu of degree of accommodative loss an appropriate
9 inclusion/exclusion criteria is uncorrected near
10 VA.

11 DR. FERRIS: Well, the reason I said
12 outcome variable is that it depends on what outcome
13 variable you are going to choose. That is going to
14 drive the eligibility criteria. So, if you choose
15 an outcome variable that says you improve by a
16 certain amount of accommodative amplitude, maybe it
17 is the accommodative amplitude that drives it. If
18 it is that you can read at a certain level, like
19 J1, then you probably want to have people that
20 can't read J1 at the start.

21 DR. WEISS: Dr. Rosenthal, did you have a
22 comment?

23 DR. ROSENTHAL: No.

24 DR. WEISS: No? Malvina, you are fine?
25 Okay. So, we are going to go on to a less

1 controversial point, preoperative endothelial cell
2 count. Any thoughts on preoperative endothelial
3 cell count? Should that be inclusion/exclusion
4 criteria? Dr. Mathers?

5 DR. MATHERS: I think it should be an
6 exclusion criterion because we do not want to do 40
7 year-olds with an 1,800 cell count.

8 DR. WEISS: So, have an age-related
9 minimum before you could enter the patient in this
10 study. Am I paraphrasing your correctly? Dr.
11 Grimmett?

12 DR. GRIMMETT: I would be in favor of just
13 what we discussed at the last couple of meetings of
14 having a sliding scale, similar to what the FDA
15 proposed based on projections into the future so
16 you would have enough cells when you are older.
17 So, the younger you are, you need a higher cell
18 count. So, I would be in favor of exactly the
19 sliding scale that we did before.

20 DR. WEISS: I would add something to that.
21 I don't believe the sliding scale could be the same
22 as the one for phakic IOL because you have more
23 trauma induced by the cataract surgery on top of
24 the IOL implantation, I would think. Or not?

25 DR. EYDELMAN: Well, the sliding scale is

1 obviously going to depend on what your endpoints
2 are, but I think you can discuss that in
3 relationship--

4 DR. WEISS: Okay. So, I think there is
5 some thought about having that as an inclusion
6 criteria, with the FDA coming up with endothelial
7 cell counts per age. Any other factors that should
8 be inclusion or exclusion criteria? It was
9 mentioned by Dr. Bressler before that patients with
10 pathologic changes, that should be included as
11 exclusion criteria as far as hyperopia/myopia. Dr.
12 Stark?

13 DR. STARK: Corneal astigmatism should be
14 considered, otherwise the patients are going to
15 wind up with multiple surgical procedures which may
16 complicate the issue.

17 DR. WEISS: So, you would like to have
18 astigmatism up to X amount?

19 DR. STARK: Yes.

20 DR. WEISS: Up to 7.5?

21 DR. STARK: I would say probably 1.5
22 because you will correct 0.75 of a diopter with a
23 corneal incision for the IOL.

24 DR. WEISS: Okay. Anyone else with? Dr.
25 McMahon?

1 DR. MCMAHON: Presuming that visual acuity
2 distance and near is going to be part of this. I
3 think there needs to be a minimum level of visual
4 acuity and the standards that are being applied for
5 distance acuity probably are fine. There aren't
6 really good standards for near acuity. We have had
7 one trial that we have seen that I have some
8 questions about that I raised at the last panel
9 meeting in terms of what those standards should be.
10 For example, preop best corrected visual acuity,
11 and for the one trial that I am familiar with there
12 was a certain percentage J3 or better enrolled.
13 Right?

14 DR. ROSENTHAL: What about distance visual
15 acuity, Dr. McMahon?

16 DR. MCMAHON: Personally, I would like to
17 see 20/25 or better.

18 DR. WEISS: Best corrected? So, basically
19 I think you are saying that these people should
20 have excellent best corrected visual acuity and
21 they shouldn't be having other pathology going on,
22 otherwise they should not be included in the study.
23 Does anyone disagree with that?

24 DR. BRESSLER: Only a comment, going on
25 the same theme of this morning, you know, wanting

1 to find out how this is going to happen in moderate
2 myopia, minus 8 and minus 10, there are a lot of
3 people out there with 20/32 vision from some slight
4 degenerative changes that may be suffering from
5 their presbyopia and I am not exactly clear why we
6 want this excellent sort of vision.

7 DR. WEISS: Dr. Mathers?

8 DR. MATHERS: You might stratify to be
9 slightly more liberal for the high myopes, I would
10 think, say 20/30 or something. If you do 20/80 you
11 are not going to learn as much but you could make
12 it softer for the higher myopes.

13 DR. BRESSLER: Then I am more comfortable
14 with even 20/40-ish where you can see if there are
15 changes.

16 DR. WEISS: Dr. McMahon?

17 DR. MCMAHON: Since the general consensus
18 was that there were active controls, you want to
19 have decent enough vision so that you can tell
20 differences between the groups. If you use either
21 historical controls or preoperative controls, then
22 I think you can have a lot more slip in terms of
23 entrance visual acuity to get to where you want to
24 go.

25 DR. BRESSLER: My last question is in

1 terms of diabetic retinopathy, and that is although
2 it is rare, there is documentation of an atypical
3 edema that develops when you have diabetic
4 retinopathy, and it is probably true when you have
5 other vascular abnormalities, like having had a
6 vein occlusion, and should those be included in the
7 mix? Presumably they would be randomly assigned to
8 both sides, but is the risk worthwhile where you
9 have a known event that can affect them and they
10 haven't lost vision from their cataract yet?

11 DR. WEISS: Dr. Ferris?

12 DR. FERRIS: I think diabetic retinopathy
13 is actually a point that should be carefully
14 addressed because there is published data showing
15 that this is a group having particular problems
16 with accommodative amplitude, particularly those
17 that have relatively severe diabetic retinopathy.
18 So, it is a group at risk but they also are
19 particularly at risk from a surgery. So, I think
20 some discussion, maybe not here but some careful
21 discussion about whether you are or are not going
22 to include them--and if you are to include them,
23 then I think you need to include enough so that you
24 can actually say something about them.

25 DR. WEISS: I assume the company in that

1 case is going to want to exclude those patients
2 because they are not going to improve their data.
3 Dr. Eydelman, did you have any comment on that?

4 DR. EYDELMAN: Basically the same thing.
5 For device investigation they exclude all ocular
6 pathology.

7 DR. WEISS: Walter, did you have a
8 comment?

9 DR. STARK: No, that was the comment I was
10 going to make.

11 DR. WEISS: Any other comments on this?
12 If the agency is satisfied with the answers to
13 question 2 we will go to question 3. What should
14 be the primary safety endpoint for the study,
15 retinal detachment rates, endothelial cell loss, or
16 any other primary safety endpoint? Dr. Bressler?

17 DR. BRESSLER: When someone has vision
18 loss so they are having cataract surgery to correct
19 that, all of the litany of side effects that could
20 occur that were given in that FDA grid are at low
21 enough rates that people are willing to undergo
22 that. But I wonder if you have to have some sort
23 of cumulative morbid event as your safety? If you
24 just said retinal detachment then, that alone may
25 not change. But if you said retinal detachment or

1 cystoid edema or endophthalmitis or features that
2 affect visual acuity, since you are starting
3 presumably with an otherwise normal eye except for
4 the presbyopia, it seems that this is a little
5 different safety question than just safety for
6 cataract surgery when there is vision loss from the
7 cataract.

8 DR. WEISS: You are saying sort of
9 cumulative--

10 DR. BRESSLER: Events that affect visual
11 acuity in some way.

12 DR. WEISS: Dr. Ferris?

13 DR. FERRIS: Just in general I object to
14 the term primary safety endpoint because if any
15 serious endpoint was reached, I think it would then
16 become a primary one. If there was lots of
17 endothelial cell loss, I don't care whether there
18 was retinal detachment or not, that may be primary.
19 If there is lots of retinal detachment it may not
20 matter how much endothelial cell loss there is.
21 So, I have sort of a general problem with picking
22 one outcome. I know why the agency does that for
23 statistical reasons, but for the harm side I think
24 you are looking at all of them, and maybe the major
25 reason for even doing this study is that you want

1 to inform patients as to what the risk is so you
2 want to measure all of these risks. Because any
3 risk that you think is clinically important we
4 should be measuring and we should be informing the
5 patients about, and I don't know which one is
6 primary; they are all primary in my view.

7 DR. WEISS: Would that be satisfactory?

8 DR. EYDELMAN: No.

9 DR. WEISS: No?

10 DR. EYDELMAN: Because--

11 DR. WEISS: Go ahead.

12 DR. FERRIS: For LASIK, didn't we have a
13 grid that you had to meet certain criteria for
14 multiple negative outcomes, that you couldn't have
15 worse than this for several different bad outcomes?

16 DR. EYDELMAN: Yes, you are correct. What
17 we are talking about is different ways of
18 constructing clinical study designs. Primary
19 safety endpoint is the terminology used under ISO
20 for clinical trial design and that is why it
21 appears here. The way it is usually done is you
22 determine the one that, as you mentioned, you base
23 your cohort size and that is why this question is
24 before the sample size and duration determination.
25 So, here we are not asking you which is the only

1 safety endpoint you will be collecting. We are
2 definitely going to be collecting information on
3 all of them. What we are asking you is which one
4 is important enough to drive the statistics, which
5 one should we base the sample size on, and that is
6 why the answer I got so far doesn't really address
7 that.

8 DR. WEISS: We have quite a few comments
9 on this. Dr. Maguire, Dr. Mathers, then Dr. Brown,
10 then Dr. Bressler. DR. MAGUIRE: I think one
11 endpoint should be the incidence of secondary
12 intraocular surgical procedures. Is that yes or
13 no? Does that sound like a not good idea to you,
14 Dr. Eydelman?

15 DR. EYDELMAN: No, I think perhaps panel
16 members are getting confused between question 3 A)
17 and the following question where different adverse
18 event rates for which we should be collecting
19 information are being addressed.

20 DR. MAGUIRE: Okay.

21 DR. EYDELMAN: I just wanted to make sure
22 that people are clear on that.

23 DR. WEISS: You stated it already, but if
24 you could stated it again for the panel, what is
25 meant by the word primary safety endpoint?

1 DR. BRUCKER: Wouldn't it be the lowest of
2 the incidence rates so that the lower rate would be
3 the retinal detachment which we would expect to be
4 lowest?

5 MR. CALOGERO: I guess it is using a
6 combination of the lowest rate plus, additionally,
7 your minimal detectable difference--

8 MS. THORNTON: Don, I am sorry, they are
9 telling me they can't hear you.

10 MR. CALOGERO: Don Calogero, FDA. We are
11 using this in an attempt to determine the sample
12 size here. So, we have all these adverse events
13 here. Some of them are at very low rates, as you
14 know. But you can't simply pick the one with the
15 lowest rate because that particular event might
16 allow a much larger minimum to detect the
17 difference. So, it really has to be what you want
18 to drive the precision of your study, what
19 endpoint, what is the most important one to drive
20 the sample size. We need that information, that
21 feedback to be able to determine the sample size
22 for the study.

23 DR. WEISS: So, let me ask you a question.
24 Dr. Bressler was suggesting to, let's say, select a
25 certain number of lines of lost vision from a

1 variety of causes. Would that be able to drive the
2 study or no? Did I understand you correctly?

3 DR. BRESSLER: Well, it was a list of
4 events that either affect visual acuity or have the
5 potential to, and those could be defined, but my
6 concern was exactly what you were bringing up in
7 the trial design, that is, if you make it, for
8 example, retinal detachment and you are doing
9 people less than 8 diopters or less than 6
10 diopters, whatever you choose, I can tell you right
11 now you are not going to be able to detect
12 difference, not that there is one but the event
13 rate is so low you won't be able to detect a safety
14 problem. But if you say to the patient after the
15 fact, well, what is my risk of something going
16 wrong--they are not asking what is my risk of
17 retinal detachment and macular edema and
18 ophthalmitis and needing another intraocular
19 surgery, etc. If those could be defined, I was
20 just expressing a possible opinion of using that as
21 your primary safety endpoint, and then it doesn't
22 have to be that large a study. You are not going
23 into 10,000, you know you are at 1,000, 400 or
24 whatever.

25 DR. WEISS: Is that potentially possible

1 or no?

2 MR. CALOGERO: It would be an unusual
3 study design. Suppose that results in a sample
4 size of 75. For that particular outcome you can
5 detect a difference between the two groups but it
6 may tell you absolutely nothing about much more
7 specific ones, say the retinal detachment rate when
8 it is small. Even if you use the historical
9 control, essentially close to 0.1 percent, 0.3
10 percent, your minimal detectable difference with
11 that sample size may turn out to be 5. So, for
12 that adverse event you can only say with any
13 confidence that it is somewhere below 5 percent if
14 you don't see it in the study. If it is above 5,
15 then it is different than that.

16 Later on in this presentation we look at
17 actually slides that go into what you can detect,
18 the sample sizes, so even for the low adverse event
19 rates for retinal detachment if your minimal
20 difference is large enough--it reaches a point, of
21 course, where the study size does become
22 reasonable. So there are two things you have to
23 weigh there. It is unfortunate this whole
24 discussion is sort of like a circle; you have to
25 look at all these factors simultaneously.

1 DR. BRESSLER: I do understand that is why
2 I am concerned because I think, if I were testing
3 this, I too would probably design a trial where I
4 am only going to include people where the event
5 rate of that retinal detachment is down to 0.1
6 percent, or something, by saying no one over minus
7 6 diopters or something. As a patient, we want to
8 know what is our risk of these other events.

9 DR. BRUCKER: And the other--

10 DR. WEISS: Dr. Brucker, we are going to
11 go with Dr. Mathers, Dr. Brown and then we will be
12 coming back to you. Was there anything else you
13 wanted to say on that point? No? Dr. Mathers?

14 DR. MATHERS: I think there are really
15 only two options, either it is the retinal
16 detachment rate or it is the endothelial cell
17 count. The endothelial cell count is going to be a
18 much softer endpoint that occurs way late in the
19 game. It is not going to be useful to do that if
20 you are talking about a study that is only three
21 years long, or whatever, and retinal detachment is
22 a reasonable thing to look at. From the examples
23 that you gave us here, you can design a study that
24 has a reasonable power for a fair sized population
25 and I think that is what you should do.

1 DR. WEISS: Dr. Brown?

2 DR. BROWN: I basically concur with that.
3 In terms of what we are trying to do as a primary
4 safety endpoint, and as everyone has said there
5 will be secondary endpoints that will also be
6 looked at, but in terms of the primary safety
7 endpoint, the numbers that you presented in your
8 grid don't seem extreme and I think that that
9 should be in part because of the implication of it
10 and in terms of later loss of function and because
11 of the lack of data that we don't have in some
12 these areas of refractive error, I think that that
13 should be the primary safety endpoint.

14 DR. WEISS: Dr. Brucker?

15 DR. BRUCKER: What was the safety endpoint
16 used for the original approval of the IOL?

17 DR. EYDELMAN: Endophthalmitis, rate of
18 endophthalmitis for the monofocal IOL.

19 DR. BRUCKER: So, the rate of
20 endophthalmitis in this study would probably be
21 higher than the projected rate of retinal
22 detachment in this study. So, would it be
23 reasonable to then look at endophthalmitis as a
24 primary safety endpoint?

25 DR. EYDELMAN: Probably not because--

1 DR. BRUCKER: Could you put that up again?
2 Or, it is not worth it I guess.

3 DR. EYDELMAN: I just want to make one
4 point, what I stated before, most likely we would
5 entertain clear lens IOLs for clear lens extraction
6 after the establishment of the safety and efficacy
7 in the cataractous population. So, what we are
8 trying to say is that if a sponsor established that
9 their MIOL is safe after cataract extraction, then
10 it is hard to say that when you take the same exact
11 material and the same exact MIOL and the only
12 difference for the population is that the rate of
13 endophthalmitis is going to be different. So, we
14 want to try to avoid the situation where a sponsor
15 comes in and claims there are no additional safety
16 endpoints to establish.

17 DR. WEISS: From what I hear from the
18 panel in terms of what primary safety endpoints you
19 can actually use, it seems like retinal detachment
20 is the one that was most frequently mentioned by
21 the members of the panel. If that is sufficient
22 for you--

23 DR. BRESSLER: Can I make one other
24 comment?

25 DR. WEISS: Yes, Dr. Bressler?

1 DR. BRESSLER: I just want to point out
2 that we have on the grid this 0.5 percent of
3 retinal detachment but it has been pointed out by
4 Dr. Lane, and it is true I think if you look in the
5 literature, that if we exclude a certain degree of
6 myopia it could be as low as 0.1 percent. So, you
7 have to take a 0.1 percent level and put that into
8 the mix as well.

9 DR. WEISS: Okay, I see agreement by the
10 agency. We will go on to part B)--Malvina?

11 DR. EYDELMAN: I am sorry, since you
12 agreed on minimal endothelial cell density as preop
13 criteria, perhaps you could look at the table on
14 your left to give us some guidance as to what cell
15 density at age 75 you recommend and then we can
16 calculate back as to the inclusion criteria.

17 DR. WEISS: This is sort of an additional
18 thing while we are on this topic. Any comments
19 from the panel as far as whether you want 1,000,
20 1,200, 1,400 or 1,500 cells left at age 75?

21 DR. EYDELMAN: Thank you.

22 DR. WEISS: Walter?

23 DR. STARK: I am going to pass.

24 DR. WEISS: Pass? Bill?

25 DR. MATHERS: I think 75 shouldn't be

1 considered the end of life for these people. They
2 probably have 20 more years to go. We should go to
3 the higher count, 1,500.

4 DR. WEISS: So, 1,500. Dr. Grimmer?

5 DR. GRIMMETT: I concur with 1,500.

6 DR. WEISS: Dr. Brucker?

7 DR. BRUCKER: What was used in the prior
8 studies of the anterior chamber IOLs?

9 DR. EYDELMAN: We weren't that advanced
10 then.

11 DR. BRUCKER: So, we have no information
12 from prior studies.

13 DR. WEISS: Seeing no other comments, the
14 only two comments voiced have been for the higher
15 levels of 1,500. Now we will go on to part B) of
16 question 3. What should be the acceptable adverse
17 event rate associated with the safety endpoint,
18 which I think we have defined here as being retinal
19 detachment rate? Dr. Bressler has mentioned that
20 it would be more towards the 0.1 because certain
21 degrees of myopia might be excluded. Dr. Ho?

22 DR. HO: I agree in general with Neil's
23 comments but we have to be a little bit careful
24 because those comments are based on cataract
25 surgery in older patients and age is a relevant

1 risk factor here. Let's say the average age for a
2 cataract patient might have been 65 years, we are
3 talking now about somewhere between 50 and 55 years
4 or 40 and 50 years, and you could be surprised with
5 a little bit of a difference there.

6 DR. WEISS: Dr. Bressler?

7 DR. BRESSLER: The younger ones though may
8 have had the higher rate if you controlled again
9 for their refractive error. So, we do see younger
10 people who are higher myopes come in with their
11 posterior capsular opacity, etc. I think that was
12 again referring to Dr. Lane's presentation, saying
13 that if we exclude some of these we are really
14 going to have a lower event rate.

15 DR. WEISS: Dr. Ferris?

16 DR. FERRIS: So, the corollary to that is
17 that if you are going to set a retinal detachment
18 rate you may want to set a different rate for
19 non-myopes and myopes because the underlying rate
20 is going to be different.

21 DR. WEISS: So, it sounds like we have to
22 set it for the high myopes, lower myopes and
23 hyperopes, or low myopes and hyperopes versus
24 higher myopes?

25 DR. FERRIS: Yes, just the two.

1 DR. WEISS: And do you want to suggest
2 what rates you would want for those, what numbers?
3 Dr. Brown?

4 DR. BROWN: I have spent some time
5 thinking about that beforehand and the 0.3 percent
6 per year, from reviewing the data, seemed to be
7 reasonable for the myopic population. We wouldn't
8 want to go beyond that. But the other thing that
9 this does imply if we separate, which I think we
10 should do, is that we are going to have to make
11 sure that the sponsor stratifies the population.
12 We need strict requirements, we need this many
13 patients within this refractive range and this many
14 patients within this refractive range for it all to
15 play out.

16 DR. WEISS: I think that is a good
17 suggestion so you won't be in a situation where you
18 have minus 15's and we don't have enough data. Is
19 that sufficient information for the agency? Well,
20 since they are discussing it, it sounds like not.
21 So, anyone else have any comments on this
22 particular issue? Dr. Brucker, do you have any
23 comments on the retinal detachment rate?

24 DR. BRUCKER: Dr. Ferris just said that we
25 had said that a couple of hours ago. I think that

1 is the proper way to stratify it. I think that is
2 correct.

3 DR. EYDELMAN: Perhaps as we go to 4 A)
4 that will be clarified a little.

5 DR. WEISS: So, what is missing for you,
6 Malvina? What haven't you gotten from the answer
7 from the panel on this one?

8 DR. EYDELMAN: The number.

9 DR. WEISS: So basically, bottom line, you
10 want a number from us as far as what we are looking
11 for the high myope rate versus the rest of the
12 population.

13 DR. EYDELMAN: What would be acceptable.
14 I think perhaps looking at the table on the left in
15 conjunction with question 4 A)--again we are in
16 this circular logic but I think what we are looking
17 at is the maximal allowable retinal detachment rate
18 that you would find acceptable. That drives the
19 sample sizes so if you now start breaking it out
20 into different subgroups, then we would have to
21 have that number of subjects for each indication.

22 DR. WEISS: Basically, if the panel is
23 willing to agree to a higher percentage, then the
24 study enrollment goes down.

25 DR. EYDELMAN: Yes. Again, you can do it

1 by sub-indications or as a group.

2 DR. WEISS: Dr. Ferris?

3 DR. FERRIS: Did I miss in a previous
4 slide that for that endothelial cell count that we
5 were already over 1,000?

6 DR. WEISS: Well, I think these are two
7 separate pieces of data.

8 DR. FERRIS: Well, no, they are not. If
9 you have a 1,000 then you have enough to look at
10 retinal detachment.

11 DR. EYDELMAN: No.

12 DR. FERRIS: What do you mean, no?

13 DR. EYDELMAN: No, because you have
14 determined that you want the retinal detachment
15 rate to be the primary endpoint and the endothelial
16 cell was as an inclusion criteria. In other words,
17 all we said was we are going to calculate back and
18 figure out what minimal endothelial cell loss the
19 subject would need in order to end up with that.

20 DR. WEISS: We are not determining
21 enrollment based on that graph even though they had
22 information on enrollment based on that graph. Is
23 that correct?

24 DR. BRUCKER: The graph says 113 patients
25 and 1,500 cells. It doesn't as go as high. If we

1 used 0.3 here we would need 321 patients. I think
2 that is the question he was asking. It is not over
3 1,000.

4 MR. CALOGERO: It depends on the duration
5 of the study. For the one-year study it is over
6 1,000.

7 DR. FERRIS: Then I agree with what you
8 said. That is why I said I wasn't sure what
9 whizzed by--

10 DR. EYDELMAN: We are going to see it
11 again in a minute.

12 DR. WEISS: So, Dr. Ferris, you are okay
13 and, Dr. Brucker, you are okay?

14 DR. FERRIS: I am okay, except I am
15 totally lost. We haven't come up anywhere
16 near--and the reason we haven't is that it is a
17 complex issue and we don't have all the numbers in
18 front of us. I am glad you have these numbers
19 because that is what we need to drive this because
20 we say they are all important and we want to make
21 sure that we pick one of the important ones, sort
22 of the least common denominator here. So, you have
23 to look at them all in combination and that is why
24 we are struggle. That is why I struggle because I
25 thought what whizzed by was 1,500. Well, if it

1 1,500 we are done. But if it is 100 we are nowhere
2 near done.

3 DR. WEISS: Unfortunately, you are not
4 done yet.

5 DR. FERRIS: Right. My view is that if
6 retinal detachment is the driving one, then we need
7 to look at two groups. We need to look at the high
8 myopes and in each of those groups you have to have
9 adequate samples.

10 DR. WEISS: Yes, basically I think I just
11 hear consensus on that. I think what Malvina
12 wanted is, okay, we agree that there have to be two
13 different groups but it would be helpful to her if
14 we gave some number for these two different groups.
15 Dr. Mathers had a comment. Was it addressing that,
16 Bill?

17 DR. MATHERS: Yes. Are we assuming that
18 for the non-high myopes the normal retinal
19 detachment rate is about 0.01?

20 DR. EYDELMAN: Yes.

21 DR. MATHERS: So, 0.1 would be ten times
22 higher?

23 DR. EYDELMAN: Yes.

24 DR. MATHERS: And 0.1 would be a pretty
25 high number and it is already ten times higher.

1 So, 0.3, 30 times higher than the normal rate is
2 too high, right?

3 DR. BRUCKER: But that is exactly the
4 reason--

5 DR. WEISS: Dr. Brucker, could you hold
6 it? Have you finished?

7 DR. MATHERS: So, I would go down on the
8 left side of the chart.

9 DR. WEISS: So, you want to go to what
10 number?

11 DR. MATHERS: 321, three years and the
12 lowest number there, the lowest allowable
13 detachment rate.

14 DR. WEISS: That is not the lowest
15 allowable detachment rate. Malvina?

16 DR. EYDELMAN: That would allow you to
17 detect maximum of 0.3 percent annual loss in a
18 three-year study.

19 DR. FERRIS: So, that is one retinal
20 detachment.

21 DR. HILMANTEL: Can I say something here?

22 DR. WEISS: Yes.

23 DR. HILMANTEL: These numbers are
24 calculated--I am sorry, I am Gene Hilmantel--these
25 numbers are calculated to try to get the minimum

1 size that let's you detect that rate, but there is
2 a caveat here. For most of these, especially with
3 the lower rates, the study would only pass the
4 endpoint if you got zero retinal detachments. So,
5 if you want to have a study that would permit one
6 or more retinal detachments and still pass the
7 criterion, you have to have a larger sample size
8 than in the chart here.

9 DR. WEISS: Basically practically, the
10 smallest percentage we could define in this, let's
11 say for the non-high myopes would be 0.3 percent?

12 DR. HILMANTEL: That is correct.

13 DR. WEISS: So, the 0.1 percent which was
14 brought out by more than one person is not
15 something you would be considering. The least rate
16 that we could consider as the panel is 0.3 percent.
17 So, let's just address that.

18 DR. HILMANTEL: I mean, you can consider
19 whatever you want to--

20 DR. WEISS: But it wouldn't be practical.

21 DR. HILMANTEL: --but the smaller it is,
22 the larger is the sample size.

23 DR. WEISS: Okay, so if it is not
24 practical, we can deal with that.

25 DR. ROSENTHAL: It is not that it is not

1 practical, if you feel that a retinal detachment
2 rate of one percent is acceptable, then it is
3 acceptable. If you feel that it is not acceptable
4 and 0.3 is acceptable, that is what is acceptable.
5 So, we need to know what you feel is an acceptable
6 retinal detachment rate.

7 DR. WEISS: Well, what was brought out
8 previously was 0.1 percent.

9 DR. ROSENTHAL: That makes the study
10 enormous.

11 DR. BRESSLER: And that is why I wasn't
12 voting for retinal detachment being a primary
13 safety endpoint because it is going to be
14 impossible to do.

15 DR. WEISS: Dr. Ferris had a comment and
16 then Dr. Brucker. Dr. Eydelman?

17 DR. EYDELMAN: I just wanted to point out
18 that our cumulative RD rate from the FDA grid is
19 0.3 percent so the chances are you are not going to
20 be way--

21 DR. WEISS: Way far off from that. We are
22 going to have Dr. Ferris, Dr. Brucker and then Dr.
23 Ho. Dr. Ferris?

24 DR. FERRIS: I guess I am a little
25 confused now with the maximum allowable retinal

1 detachment rate. If your expected number is one
2 detachment and you get one detachment, you have no
3 idea what the rate is. If these 321 people bought
4 lottery tickets and somebody one, the rate of
5 lottery ticket winning would not be 0.3 percent.
6 We need at least a couple of events to be able to
7 say anything about retinal detachment. I also
8 agree with what Neil was saying, that is, it may be
9 unreasonable to power a study to get an accurate
10 assessment of retinal detachment rate. So, somehow
11 there has to be a balance between reason and what
12 you would like.

13 DR. WEISS: Dr. Brucker?

14 DR. HILMANTEL: Can I say something?

15 DR. WEISS: Yes.

16 DR. HILMANTEL: Gene Hilmantel again. In
17 this type of pre-approval study, you are absolutely
18 correct, the only thing you can demonstrate really
19 with any confidence is that the rate is less than a
20 certain maximum allowable rate that we would
21 select. To really get a handle on the rate you
22 need many more patient years and that can probably
23 only be addressed in a post-approval type of study.

24 DR. WEISS: Dr. Brucker?

25 DR. BRUCKER: Yes, I think that the

1 problem is that when you talk about the rates and
2 you have 0.3 most people might say that is fine for
3 the entire cohort. But now you are talking about
4 splitting them up, and if you start to split them
5 up and you only have one rate we are not saying
6 that you are going to look at them all with the
7 same end rate. So, if you wanted to go down to 0.1
8 you would be at 1,000 patients or whatever it is,
9 it is too many. So, you are going to have to go
10 back and recalculate. You are asking us for a
11 number and that is not what we are offering you.
12 We are telling you as doctors and surgeons that
13 that rate is going to be extremely, extremely low
14 and we don't expect that. This is an acceptable
15 rate if you take a look at the whole cohort. One
16 percent is unacceptable. If now your rate, as Rick
17 was saying, is zero in the series of patients that
18 are done that are medium myope and emmetrope you
19 will have no retinal detachments, in other words,
20 and you got one or two in the other group, the high
21 myopes, that is going to be all right but you are
22 going to be analyzing them separately. So, you
23 can't keep asking us what is the number; what is
24 the number if you are going to analyze two groups
25 separately. Do you understand what I am saying?

1 DR. WEISS: But can't you just give two
2 numbers?

3 DR. HILMANTEL: You can give us guidance
4 if you want.

5 DR. BRUCKER: The point is that the 0.1
6 for the emmetropic patient would give you 1,000
7 patients which is unacceptable. If you go up to
8 one percent in the high myope, that also is too
9 high. So, you are going to have to look at the
10 aggregate number; 0.1 percent is too high and 0.1
11 gives you 1,000 patients. We can't design a study
12 based upon that. Now, if you wanted to ask
13 everybody in this room whether they think it has to
14 be less than one percent retinal detachment rate
15 regardless of the group of patients being looked
16 at. Does that make sense?

17 DR. WEISS: Dr. Eydelman?

18 DR. EYDELMAN: It makes sense but I am
19 just trying to get further guidance. I mean, what
20 we are saying is that you have a different maximum
21 allowable rate depending on the population.

22 DR. BRUCKER: Right.

23 DR. EYDELMAN: That is fine. What we are
24 asking you is tell us, please, what the two
25 populations are and what would be the maximum

1 allowable rate for each of the populations. Then
2 we can go ahead and design a study around it.

3 DR. BRUCKER: So, Neil and myself would
4 respond to you by saying that had you made a
5 table--and these tables are wonderful; I
6 congratulate both of you for doing this--had you
7 made a table, one of them being from emmetropia to,
8 let's say, minus 6 and the second table from minus
9 6 to minus 16 you probably would have had two
10 numbers because the literature that you have
11 described gives you different retinal detachment
12 rates. But you didn't give us that; you are only
13 giving us one aggregate and we can't give you an
14 answer because we don't know the number.

15 DR. WEISS: Dr. Ho?

16 DR. HO: I was going to echo Sandy's
17 comments precisely. I think that if you look at
18 the literature you presented, there is one study of
19 52 myopes where the retinal detachment rate was an
20 astounding 2 percent at 4 years and then up to 8
21 percent at 7 years. This conversation is beyond my
22 comfort level to start with for clear lens
23 extraction for presbyopia. I am way on the left
24 over here and way down in numbers of years. I
25 understand the limitations. I think this is a very

1 significant public health issue. I think there
2 could be many thousands, millions of patients that
3 could be--seduced is maybe not the right word but
4 that would be enticed by advertisements of throwing
5 your glasses away. I think we need to be more
6 careful here. If you ask me for numbers I would
7 say for the general group 0.3 is probably okay; for
8 the myopes, you know, something a little bit higher
9 but not too much higher.

10 DR. WEISS: I understand what Dr. Eydelman
11 is asking us for and I understand the sentiments on
12 the panel but I still think we can get more in the
13 direction of what you are saying, not an exact
14 number but I would assume that everyone here would
15 agree that you wouldn't want to be higher than one
16 percent for the high myopes. Would anyone disagree
17 with that? Would anyone want to have a higher
18 percent than one percent RD rate for the higher
19 myopes? So, one percent would be the maximum for
20 the high myopes.

21 DR. HILMANTEL: Can I just clarify?

22 DR. WEISS: Yes.

23 DR. HILMANTEL: That wasn't the rate per
24 year. So, if it is one percent per year over ten
25 years it would be ten percent.

1 DR. WEISS: Dr. Bradley?

2 DR. BRADLEY: I think starting with Dr.
3 Lane's presentation this morning and everything I
4 have heard from our esteemed surgeons here, the
5 impression I get is that the lens extraction
6 procedure is now so safe that with reasonable
7 numbers you are not going to be able to evaluate
8 whether a particular clear lens extraction product
9 or lens that is going to be put in is going to
10 elevate the hazard by any reasonable amount. You
11 are simply not going to be able to evaluate that
12 because the procedure itself is so safe. All you
13 can do with these numbers is essentially screen for
14 a disaster; you cannot evaluate whether there is a
15 reasonable increase in hazard because the procedure
16 itself is so safe. It can only be done post-market
17 with large sample sizes. But I believe these
18 numbers seem reasonable as a screen for a disaster
19 basically and I think what the people around the
20 table are saying is that the number of 0.3 percent
21 sounds about reasonable.

22 DR. WEISS: The agency will speak,
23 obviously, but I am going to think that Dr.
24 Bradley's comments should probably be the bottom
25 line here, that most people have voiced 0.3 percent

1 so why don't we leave it at 0.3 percent and you can
2 see that there is a lot of discussion and
3 discomfort on this issue? Do you have any comments
4 on this?

5 DR. HILMANTEL: Yes, my only comment that
6 one of the questions we are asking you in essence
7 is, is this something that we should look at in a
8 pre-approval study, given that all we can do is
9 establish that the rate is less than a certain
10 amount?

11 DR. WEISS: Dr. Maguire?

12 DR. MAGUIRE: I am going to look at it
13 from a patient standpoint. You can look at it two
14 ways, you can say a low incidence of retinal
15 detachment or you can say my risk of retinal
16 detachment is five or ten times higher over X
17 period of time if I have this done than if I don't
18 have this done. That is how patients think about
19 it. Okay? And, we are talking about incidences 10
20 or 30 times higher and barely being able to detect
21 it. I also understand that if we did a study to be
22 able to detect something 3 or 5 or 10 times higher
23 than expected, it would be too many patients.

24 So, what that tells me is that the public
25 health effects of clear lens extraction and retinal

1 detachment are not going to be elucidated by any
2 pre-approval study by the FDA. It is not going to
3 happen. So, there is a potentially serious public
4 health effect if clear lens extraction in
5 pseudophakic IOLs that will remain after this study
6 goes. It will have to be addressed elsewhere.

7 We had absolutely no analysis from Dr.
8 Lane on how he came to the conclusion of retinal
9 detachment when the confounding factors were
10 removed. I am not at all sure if he included YAG
11 laser capsulotomy in that or not. If that was an
12 issue, obviously that can be up in the 30 and 50
13 percent.

14 DR. WEISS: Because of interest in time
15 and we have five more questions to get through and
16 less than an hour to do it in--I still hear the
17 sentiment from the panel that that should be
18 included. The number is controversial but 0.3
19 percent has been mentioned more than once. If that
20 is satisfactory for you we will go on to question
21 4.

22 DR. EYDELMAN: And I understood 3 is
23 pre-PMA because the question was twofold,
24 percentage and the number of years before the PMA.
25 I saw a couple of people pointing to number 321

1 which implies 3 years.

2 DR. WEISS: In 4 (A, are we not going to
3 get to the duration of the study?

4 DR. EYDELMAN: No.

5 DR. WEISS: Because in 3 I didn't think
6 the amount of time for the study was being
7 addressed, unless you want us to address it now.
8 It just said adverse event rate.

9 DR. EYDELMAN: No, we were discussing 4
10 (A.

11 DR. WEISS: No, we haven't gone to 4 (A
12 yet or, if we did, I didn't know it. Maybe I
13 missed it. So, you want us to get involved in the
14 duration of the study.

15 DR. EYDELMAN: It was a conjoined effort.

16 DR. WEISS: Is there consensus that it
17 should be three years? Dr. Ferris?

18 DR. FERRIS: I would say three years is a
19 good minimum length for the study, and I was going
20 to make a suggestion with regard to a slightly
21 different approach to sample size, and that is that
22 I think people would like to know if there is a one
23 percent risk, and I think you could power the
24 studies so that you would have enough power to give
25 a reasonable estimate of the absolute risk.

1 There are two issues here. One is the
2 relative risk and one is the absolute risk. The
3 absolute risk is almost uninterpretable by patients
4 because one percent, a tenth of a percent or a
5 millionth of a percent--they think it is very low.
6 So, it seems like you need some sort of confidence
7 as to what the actual rate is so you can say it is
8 one percent but that is ten times higher than what
9 you would have if you don't have this procedure. I
10 think you need both numbers, and you need enough
11 cases to have some confidence about what that
12 number is. The 321--I am glad someone else pointed
13 out that I don't read the graphs very carefully
14 because it is per year so that is actually three
15 cases. I think you can do the math; the agency can
16 do the math to get some sort of reasonable
17 confidence because I think the most important thing
18 we are going to do is to be able to tell these
19 patients what their risk is and you need enough
20 patients to be able to tell them what the risk is,
21 and then the Admiral Farraguts can go ahead and the
22 Hamlets can think about that and not do it, but at
23 least they would have something to base their
24 determination on.

25 DR. WEISS: Dr. Stark?

1 DR. STARK: But if we are going to have
2 two groups, the mid-myopes and the high myopes,
3 then we are talking about twice that number. Could
4 we compromise and say 0.3 for the lower myopes and
5 hyperopes and 0.5 for the others? That would give
6 a total of a little over 500 patients, which is
7 what the cohorts have been in the past.

8 DR. WEISS: Dr. Ferris?

9 DR. FERRIS: I am sorry, I did the math
10 for the non-myopes. The math for the myopes is
11 going to be a smaller number because you are going
12 to have more events. So, you would need maybe a
13 third of the number or less because their rate is
14 something like one percent per year so you are
15 going to need a much smaller number.

16 DR. WEISS: That is a good point, Walter.
17 Three years is what we are talking about, it seems.
18 Dr. Bressler?

19 DR. BRESSLER: I just want to make a
20 discussion point about potentially considering two
21 years. Most of the literature, to my knowledge,
22 suggests that complications that happen after
23 cataract surgery happen within a year's time. So,
24 by going to two years we will catch them, if there
25 were some additional problems going on. But it

1 gets more and more expensive and less likely to get
2 follow-up as you try and get these people out to
3 three years. So, I am not sure we need that third
4 year.

5 I will point out that in the clear lens
6 extraction minimum data that FDA presented this
7 morning, which was very helpful, that 8 percent
8 rate was because there were some detachments
9 happening at three, four and five years after the
10 cataract surgery and these were high myopes. So,
11 it is not clear in my mind if that is just
12 detachments that were going to occur due to the
13 pathologic myopia anyway. We just don't have any
14 strong data to suggest that there is an increased
15 retinal detachment rate beyond the one to two
16 years. So, I am just suggesting that you could
17 consider two years.

18 DR. WEISS: Just for members of the panel,
19 for those who were at the last two meetings, we
20 always get involved in these difficulties with
21 endothelial cell loss. That probably won't be an
22 issue here because it is a standard operation, but
23 the less number of years of data you have, the more
24 difficult it is to try to figure out what is going
25 on.

1 DR. BRESSLER: I was only talking about
2 retinal detachment.

3 DR. WEISS: You know, that is something
4 the panel can discuss.

5 DR. BLUSTEIN: Could I say something?

6 DR. WEISS: Yes.

7 DR. BLUSTEIN: This is Joe Blustein from
8 the FDA. The relative risk for retinal detachment
9 is greatest within the first year. It is about
10 10-20 times greater having cataract surgery than
11 not, but it still continues out and after 4 years
12 it is still 6 to 7 to 10 times greater than not
13 having surgery. So, the risk of retinal detachment
14 persists even beyond that first, second and third
15 year.

16 DR. WEISS: Dr. Ho?

17 DR. HO: I would echo those comments that
18 were just made. I think I would be comfortable
19 with a shorter follow-up for those patients that
20 are less at risk, that is, those that are low
21 myopes, emmetropes or hyperopes that we have
22 included. But I would like to see longer studies,
23 particularly considering some of the literature
24 that is out there for the higher myopes.

25 The other issue is that the cataract

1 surgery results are for a group of patients that
2 are older. This is clearly a different set of
3 patients and if you are younger and you are more
4 myopic I am not as comfortable with two years. I
5 think I would be reasonably comfortable with two
6 years for the non-highly myopic group.

7 DR. WEISS: Dr. McMahon?

8 DR. MCMAHON: I would like to support Dr.
9 Bressler's view. At several of these types of
10 meetings where we have tried to look at these
11 shallow slope differences, we are always left with
12 a quandary and I think we have an opportunity here,
13 since the majority of the retinal detachment risk
14 associated with the surgery is in the first year or
15 so, of shortening the Phase III trial. But then I
16 would like to argue for a detailed post-market
17 study for a much longer period of time to pick up
18 those sorts of things. That is exactly where that
19 prospective case control kind of thing can come
20 into play that I mentioned earlier.

21 DR. BLUSTEIN: In the large cohort studies
22 about 40 percent of the retinal detachments
23 occurred within the first year, and then 60 percent
24 occurred within years two to three or four and that
25 was the length of those cohort studies. That is

1 just information.

2 DR. WEISS: What I am beginning to hear is
3 sort of a trend, especially in view of the primary
4 safety endpoint of retinal detachment, that a
5 two-year study with post-market follow-up would be
6 sufficient. Does anyone have any disagreement with
7 that? Dr. Mathers?

8 DR. MATHERS: There would be an advantage
9 in endothelial cell count to look at a three-year
10 point, and I am going to predict that 40 years
11 after the operation the endothelial cell count is
12 going to be the more important number than the
13 retinal detachment rate. So, I would argue for
14 three.

15 DR. WEISS: But would you be averse to
16 having that post-market?

17 DR. MATHERS: That is fine.

18 DR. WEISS: Because we could still include
19 that in post-market. Dr. Ferris?

20 DR. FERRIS: Just one last comment,
21 although I agree with you that the endothelial cell
22 count is going to be important, remember that the
23 retinal detachment rate, as was pointed out,
24 doesn't stop. So, when you multiply 25 years, 30
25 or 40 years times that, that is going to be a

1 pretty ugly number too.

2 DR. WEISS: Dr. Stark?

3 DR. STARK: I think in the original study,
4 the standard study, I would like to see a little
5 longer than three years to ensure that we are not
6 opening Pandora's Box here. There has not been a
7 lot of clear lens extraction in 40 year-old normal
8 people. But with the tight vitreum- retinal
9 adhesion in those patients the fact that we are
10 going to be jarring that, maybe separating it and
11 causing some retinal detachments we may see an
12 unusually high number of retinal detachments in
13 these people and thinking, well, no, they were just
14 supposed to be the myopes that got the retinal
15 detachments.

16 So, I am a little concerned about it. You
17 know, when you see the cataract patients you look
18 at them and, as a clinician, most of the myopes and
19 the young cataracts will have vitreous detachment
20 already and that may be contributory to the cause
21 of the cataract. There may be an association. So,
22 this may be an entirely different group of people
23 that have a very tight vitreum-retinal adhesion.
24 So, I would rather see the three years. What I
25 would to ensure though is that we get that

1 post-approval follow-up on those patients in high
2 numbers because I think if something still can be
3 done, or at least the public education, if four and
4 five years out--Joseph Colin criticized the Italian
5 group for saying that there was a high rate of
6 retinal detachments in these patients at four years
7 because he only had two percent, but then it went
8 to eight percent at eight years. So, I think we
9 just want to make sure we are not missing a big
10 problem.

11 DR. WEISS: So, agency, I think you can
12 hear the mixture of opinions, somewhere between two
13 and three years and I think the points you raised
14 here are important ones about the vitreous and
15 younger patients.

16 We are going to go on to B), do you
17 believe a post-market study is indicated? I am
18 going to answer that. The impression I get from
19 the panel is that most people are talking about a
20 post-market study. If so, what is an appropriate
21 type of study, sample size and length of follow-up
22 for such a study? That is all going to get
23 answered in about the next four minutes. Anyone
24 have a quick answer for that one? Walter?

25 DR. STARK: If you are just looking at

1 retinal detachment events you should be able to
2 pick that up and visual acuity and YAG laser
3 capsulotomy probably. So, I would say five years.

4 DR. BRESSLER: I would echo that--

5 DR. WEISS: Dr. Bressler?

6 DR. BRESSLER: I am sorry, yes, as you go
7 beyond five years in this age group, they start
8 moving around and you can't even follow them and I
9 don't think you will have data to interpret as
10 well, so to be reasonable with what is expected and
11 what we are looking for, I think five years is a
12 good number.

13 DR. WEISS: Dr. Blustein?

14 DR. BLUSTEIN: I think you need to be
15 aware that a post-market study doesn't necessarily
16 mean following the same cohort that was in the PMA.
17 It can be following a new cohort once this lens is
18 out in the market or a sample of that cohort and it
19 can be followed for five years or longer to see
20 what complication rates are.

21 DR. WEISS: So, Dr. Start and Dr.
22 Bressler, when you were speaking about five years
23 did you mean the same cohort?

24 DR. BRESSLER: Not necessarily.

25 DR. WEISS: Not necessarily? And would

1 you want a new cohort followed for a five-year
2 period of time or would you like to follow the same
3 cohort?

4 DR. EYDELMAN: Well, it depends on the N.

5 DR. BRESSLER: Right. You would probably
6 have to add to that cohort because, right, you
7 wouldn't have enough.

8 DR. WEISS: Dr. Blustein?

9 DR. BLUSTEIN: Comments that have kind of
10 come to the panel in the past about this is in the
11 hands of the best surgery on a group, and it is a
12 whole different issue once it gets out there into
13 the market. I think that you have to take that
14 into account too, that retinal detachment rates,
15 complication rates may be very low in this cohort
16 but once it is out in the market it might be a
17 different issue.

18 DR. WEISS: So, you are bringing up the
19 point that it might be beneficial to have a new
20 cohort and you would want to know from us how many
21 years and what is the sample size. Is that
22 correct?

23 DR. BLUSTEIN: Correct.

24 DR. WEISS: Dr. Rosenthal?

25 DR. ROSENTHAL: I just wanted to comment

1 that it is fairly obvious that there are two
2 approaches you can take, both of which you have
3 mentioned. You either follow the existing cohort
4 out to whatever time you feel appropriate or you
5 set up another type of study. Now, the other study
6 can't be as intense as the existing study. I think
7 this panel has been told several times that there
8 are other ways of doing post-market studies. For
9 example, with the 30-day contact lens there was a
10 very large number of patients being enrolled for a
11 reasonable--I forget what the time frame is, in
12 which only major events are being reported. It
13 seems to me a similar type of post-market study
14 could be arranged here where you enroll so many
15 patients and you look for major events. We are not
16 interested in visual acuity; we are interested in
17 whether or not they have had a retinal detachment
18 or whatever else you are interested in.

19 So, you can approach it either way and we
20 need the panel's input on which way do they think
21 is the best way to approach it.

22 DR. WEISS: Dr. Blustein, Dr. Mathers,
23 then Dr. Stark and Dr. Ho.

24 DR. BLUSTEIN: You don't have to be
25 specific about length of time to follow and sample

1 size. That can all be handled through the agency.
2 We just need to know the events of concern that the
3 panel wants to address.

4 DR. WEISS: I think the one event of
5 concern that everyone is bringing up is retinal
6 detachment. Dr. Maguire?

7 DR. MAGUIRE: The one event that
8 definitely would need a separate population is
9 removal of the lens or other secondary intraocular
10 procedures down the line. I think it is very wise
11 to look at what we have learned from cataract
12 extraction with presbyopic correcting lenses in
13 cataractous patients. One thing we found with the
14 Array lens is that even though in the initial
15 cohort there was a sizeable class that were unhappy
16 with their procedure. They didn't elect to have
17 them removed when it went into general circulation.
18 About that same percentage that were unhappy now
19 decided to have their lens implant removed, five or
20 seven percent. So, I think absolutely we need
21 that.

22 The other thing is that we need to have a
23 fairly long period of follow-up because we don't
24 know if the accommodative efficacy will remain
25 stable and if the degree of optical degradation in

1 some of these lenses will remain tolerable after
2 the initial period of euphoria.

3 DR. WEISS: Dr. Mathers

4 DR. MATHERS: I agree with those comments
5 and also you are going to need to measure
6 endothelial cell count and the longer duration you
7 have the better because you are trying to draw an
8 extrapolation over 40 years, and you simply can't
9 do that on a three-year time point. I think that
10 is going to be important.

11 DR. WEISS: The other thing that I would
12 mention, which was mentioned by a panel member
13 before, is YAG capsulotomy. I think you mentioned
14 that, Leo. Dr. Ho?

15 DR. HO: They covered it.

16 DR. WEISS: Dr. Stark?

17 DR. STARK: I was just going to say that
18 YAG laser capsulotomy increases the risk of retinal
19 detachment by about three times. So, we have to
20 know that number and it might be nice to know that
21 number out to five years so I would think that if
22 you could follow a subset of the original cohort.

23 Also, the other thing that would be nice
24 to know, and maybe by ultrasound to obtain it, is
25 what is the status of the vitreum before these

1 surgical procedures and what happens afterwards.

2 DR. WEISS: I think the endpoints we are
3 talking about are retinal detachment, secondary
4 intraocular lens procedures, YAG capsulotomy.
5 Anything else you need to know from us on this
6 question? Dr. Brucker?

7 DR. BRUCKER: I guess once it goes out
8 into the public for a new cohort, you may look at
9 retinal detachments but you may have a lot of
10 broken capsules by other surgeons. So, it might e
11 worthwhile to make sure that you have
12 intraoperative complications so that you know how
13 to interpret the retinal detachments.

14 DR. WEISS: Yes, I think that is an
15 excellent point because your rate of RD goes up by
16 five percent or something. Are you okay, agency,
17 on question number 4? If so, we will move to
18 question number 5.

19 DR. EYDELMAN: So, there was basically no
20 consensus on the sample size or follow-up?
21 Correct?

22 DR. WEISS: What I understood the last
23 comment to be is you didn't need the sample size
24 from us but the follow-up, from what I was hearing
25 here, was about five years.

1 DR. EYDELMAN: We don't need the sample
2 size if we have a rate.

3 DR. WEISS: A rate of what? Retinal
4 detachments?

5 DR. EYDELMAN: That we are trying to
6 detect. It is one or the other.

7 DR. WEISS: Would anyone be averse to
8 suggesting the same rate that we had for the study?
9 Would there be any objection to that?

10 DR. MAGUIRE: I think it should be lower.
11 I think we should think in terms of relative risk
12 of retinal detachment and other things happening
13 compared to baseline.

14 DR. WEISS: The problem that Dr. Brucker
15 introduced is that the level of surgery may go down
16 so to expect the complication rate to go down might
17 not be practical. Dr. Bressler?

18 DR. BRESSLER: But I think we want to
19 inform the public what is their minimal risk that
20 we are reasonably sure that they are taking on from
21 this post-marketing survey. Because we can't do
22 that from the original trial that is planned. From
23 the original trial we can say, let's say for the
24 non-high myope, okay, your risk is no greater than
25 30 times, you know, retinal detachment. To me,

1 that is all that we can get out of that original
2 trial but that is not acceptable for the safety of
3 the tens of millions that this could apply to.

4 DR. WEISS: So, do you have a percentage?
5 Would you want to go back to the 0.1 percent?

6 DR. BRESSLER: I would actually go even
7 lower, 0.05 and say, well, your risk is not greater
8 than times what your retinal detachment rate is.

9 DR. WEISS: Dr. Maguire was agreeing on
10 that. Is that acceptable to the agency, just to
11 say 0.05 percent retinal detachment rate with
12 five-year follow-up? Dr. Stark?

13 DR. STARK: How many patients would you
14 need?

15 DR. WEISS: Well, I think what they were
16 saying is that the amount of patients would be
17 driven by the percentage of the primary safety
18 endpoint. Is that correct?

19 DR. EYDELMAN: Right. What we are saying
20 is there are two ways you can do it. You can
21 either tell us the sample size, we think if 2,000
22 eyes are followed for 5 years it will give us
23 enough information. Or, you can tell us the rate
24 that you want us to figure out--

25 DR. WEISS: So, Dr. Bressler and Dr.

1 Maguire who were agreeing, would you prefer to go
2 with a percentage or would you prefer to define a
3 sample size?

4 DR. BRESSLER: I like 0.05 and following
5 out to five years. My guess is that it will end up
6 being about 2,000 people followed in this
7 post-marketing survey.

8 DR. WEISS: Dr. Stark, were you in
9 agreement with that way of going about it?

10 DR. STARK: Yes.

11 DR. WEISS: Dr. Brucker?

12 DR. BRUCKER: Just to clarify, are you
13 saying that you think that it is worthwhile in a
14 post-marketing surveillance to follow these
15 patients at a more stringent level? You are saying
16 0.5?

17 DR. BRESSLER: No, 0.05. I am just
18 looking for retinal detachment, and 0.05 is five
19 times what their expected retinal detachment rate
20 is if they had not had the surgery. So, we can
21 tell them you are not taking a risk any greater
22 than five times the risk. Is that what a
23 reasonable person might want to know in doing this?

24 DR. WEISS: Dr. Ho, yours will be the last
25 comment on this particular thing because we are

1 running late.

2 DR. HO: I think the public needs to know.
3 I think we will have incomplete information on
4 informed consent which, in my opinion, is really
5 why we are here and it is still a "buyer be aware"
6 situation. But I think the public looks at the
7 absolute rates more than they do the relative
8 rates. Is my chance of infection 1/100? Okay, I
9 will make my judgment. Five times 1/10,000 is less
10 meaningful obviously. So, I would be comfortable
11 for a large number of patients over five years and
12 I would be comfortable with, let's say, 2,000
13 patients over five years.

14 DR. WEISS: I think we are all saying the
15 same thing so we can move on. We are talking about
16 0.05 percent or the rate or approximately 2,000
17 patients and they may be coinciding. You are not
18 fine with that?

19 DR. EYDELMAN: No, I am fine with that. I
20 have just been told that 2,000 will not do it.

21 DR. WEISS: How many will do it?

22 DR. EYDELMAN: We don't have the numbers
23 but from what I hear they will be much higher.

24 DR. WEISS: Dr. Stark?

25 DR. STARK: I was just going to ask is

1 that too onerous for the companies? They will say,
2 well, fine, we will just to continue to use it
3 off-label. You need to get a little input from the
4 companies about what they would think they could
5 possibly do; 2,000 people followed for five years
6 is a lot of patients.

7 MR. MCCARLEY: And it is times two because
8 you divided that into two groups.

9 DR. WEISS: So, we would have to have
10 4,000 patients--

11 MR. MCCARLEY: More than 4,000.

12 DR. WEISS: Basically, by creating a 0.05
13 percent that is still too onerous. That is what
14 you are saying.

15 DR. EYDELMAN: Well, it is definitely your
16 recommendation whether it is too onerous or not.
17 But we are saying it is going to be a very large
18 sample size.

19 DR. BRESSLER: Although the market may be
20 tens of millions of people.

21 DR. WEISS: Dr. Ho, and this will be the
22 second last comment for Dr. Ho.

23 DR. HO: I would strongly echo Neil's
24 sentiments there, the market could be much more
25 significant and we need to do that. I will give

1 you an example, we had a new treatment for patients
2 with macular degeneration. We followed over 4,000
3 patients for a shorter time period but, again, you
4 need that N to get the numbers.

5 DR. WEISS: So, there is consensus. I
6 will leave it at that. Question 5, acceptable
7 adverse event rates for posterior chamber IOLs at
8 one year following cataract extraction are listed
9 in the FDA grid. A), are these rates applicable
10 for correction of presbyopia in non-cataractous
11 eyes via clear lens extraction at one year postop?
12 So, do you want to use the same rates in clear lens
13 extraction as are listed on the FDA grid? Dr.
14 Stark is nodding yes. Dr. Maguire is nodding no.

15 DR. STARK: I wasn't nodding.

16 DR. WEISS: You weren't nodding?

17 DR. STARK: You were trying to speed this
18 along!

19 DR. WEISS: Dr. Maguire?

20 DR. MAGUIRE: I am not saying what number
21 it should be but if you are looking in terms of
22 public health effects, people that have serious
23 persistent problems starting at a younger age has a
24 much bigger impact, especially in a working
25 population. So, I think we should be more

1 stringent.

2 DR. STARK: I agree, and the
3 cumulative--cumulative, not transient--cumulative
4 macular edema of three percent is too high to be
5 acceptable for clear lens extraction.

6 DR. WEISS: I would also agree. You
7 always have to weigh risk/benefit and even though
8 people find such difficulties with presbyopia, I
9 still think the benefit is less than if you had a
10 visually significant cataract so we have to look at
11 the risk a little differently. Is there a
12 consensus that the grid should not be the same as
13 what is applicable for cataractous eyes? If there
14 is consensus, do you need anything else from us on
15 A)? Please don't tell us you need percentages in
16 each category. He who hesitates is lost, Malvina,
17 so we can move on to number B).

18 DR. EYDELMAN: Well, number B) asks for
19 percentages.

20 DR. WEISS: Oh, I see. Should acceptable
21 adverse event rates be adjusted for study duration?
22 If yes, how? These were for one year, correct?

23 DR. EYDELMAN: Correct.

24 DR. WEISS: Now we have three years in
25 non-cataractous eyes. Does anyone think the

1 study--well, obviously we all do. So, now you need
2 to tell us numbers?

3 DR. EYDELMAN: Hopefully. I mean, you can
4 pick one or two categories.

5 DR. WEISS: Dr. Ho and then Dr. Grimmer.

6 DR. HO: Keeping in mind what we are
7 trying to do here, risk/benefit presbyopia versus
8 loss of vision from a cataract, I would almost look
9 at these numbers and say, you know, ratchet me down
10 one log unit down the board and I would almost find
11 that acceptable I think.

12 DR. GRIMMETT: I agree with Dr. Stark that
13 the cumulative macular edema at three percent seems
14 high. I think that is too high to be acceptable in
15 clear lens extraction.

16 As I mentioned earlier, the cumulative
17 hyphema rate--I was astounded to see that it is
18 listed at 2.2 percent, quite frankly, because just
19 thinking about my practice I just don't see
20 hyphemas after cataract surgery certainly with
21 modern phaco. That is why I was wondering if that
22 was driven by old extra-cap or some other type of
23 surgery. Does anybody else here see hyphemas after
24 cataract surgery? So, I think for that rate to be
25 an acceptable rate and just let it ride, I think

1 that should be exceedingly low, hyphema after clear
2 lens extraction. I can't remember one in ten
3 years.

4 DR. STARK: And it will be because
5 probably many of these were limbic incisions,
6 scleral incisions and that is why there was a
7 little circulating hyphema. But now, with clear
8 corneal incisions it would be less than one
9 percent.

10 DR. WEISS: Dr. Eydelman, you were saying
11 this was from the '80s to the early '90s, this
12 grid?

13 MR. CALOGERO: '87 to '96.

14 DR. WEISS: We do have something more
15 recent than this or no?

16 DR. EYDELMAN: We have a draft of
17 something that is more recent but it hasn't been
18 vetted.

19 DR. WEISS: Do you need more from us on
20 this? Dr. Rosenthal?

21 DR. ROSENTHAL: This, to me, is one of the
22 bigger issues. You are subjecting patients to
23 surgery with a cataract. These are the rates which
24 have become acceptable to get a new lens on the
25 market. Now, are you going to ratchet them all

1 down by a factor of ten or a factor of one-third?
2 What is going to be acceptable? I can't imagine--I
3 may be stupid but I can't imagine if you operated
4 on patients for a refractive exchange that you are
5 still not going to get a percentage of
6 complications. They are not going to come out
7 complication-free.

8 DR. WEISS: Right. Dr. Bressler?

9 DR. BRESSLER: I am going to echo what
10 Allen said, and that is that when you already have
11 good vision and a clear lens, having macular edema
12 at the level of 0.3 percent might be the most that
13 the subject could possibly comprehend and we were
14 willing to accept a retinal detachment rate of
15 that. I am somewhat comfortable accepting that as
16 the macular edema rate that we want to be able to
17 identify.

18 DR. WEISS: So, you would like the macular
19 edema rate for three years to be what? This is the
20 one-year rate for cataracts. What would you like
21 for clear lens extraction?

22 DR. BRESSLER: I am still okay with 0.3
23 percent because in that case, again, it is going to
24 happen almost all in the first year and you are not
25 going to have people who then develop it additively

1 in the second or third year.

2 DR. WEISS: So, at least we have a comment
3 on one of them of a 0.3 percent on macular edema.
4 We are going to have Dr. Grimmatt and then Malvina.

5 DR. EYDELMAN: Perhaps I can make it a
6 little simpler. If we are talking about a
7 three-year study for 300 subjects, or so, the
8 maximum detectable rate for cumulative adverse
9 events would be 0.3. So, perhaps we could ask do
10 you feel that a rate of higher than 0.3 would be
11 acceptable because we can't really detect with any
12 precision anything below 0.3 percent?

13 DR. WEISS: So, what you are saying is for
14 any of these categories, would we want to be less
15 stringent than we are for the cataracts? Would we
16 want a higher rate than what is being reported for
17 cataracts? Did I misunderstand?

18 DR. EYDELMAN: No.

19 MR. CALOGERO: These are the mean rates
20 here. We worked the statistics off these rates.
21 If you have a pupillary block of, say, 0.1 percent
22 that is the mean rate. This is a historical grid.
23 Your study fails at one percent. So, your minimal
24 detectable difference then would be 0.9. So, at
25 the 0.1 you are failing at one percent. I ask what

1 Malvina is asking is what would you find
2 acceptable. With a three-year study with 300
3 subjects it would be 0.33. That 0.33 would
4 correspond to a much lower actual mean rate. In
5 your actual study you could have a rate up to 0.33
6 and it would not be detectably different from the
7 rate of 0.1.

8 DR. BRADLEY: I think we have basically
9 got the idea that we are sample size limited and if
10 we are specifying very low rates on a particular
11 type of risk, lower than the rate which is driving
12 the sample size, then we are not ever going to
13 establish that rate. We understand that.

14 DR. EYDELMAN: Correct. Perhaps we can
15 just concentrate on a few on the list which are
16 above one percent or 0.8 and above and wee how
17 those should be adjusted.

18 DR. WEISS: So, we are really only talking
19 about hyphema and everybody agrees that rate is too
20 high in macular edema.

21 DR. EYDELMAN: And secondary surgical
22 intervention.

23 DR. WEISS: Dr. Brucker?

24 DR. BRUCKER: So, the issue of macular
25 edema is probably not correct because it is based

1 on prior literature, extracapsular procedures, etc.
2 So, it is probably much lower to begin with because
3 these are 1980 data through 19-something. So,
4 phacoemulsification posterior chamber IOL has a
5 much lower rate. You are asking us what rate is it
6 or what should it be. Neil is an authority and has
7 written a couple of papers. Where should it be in
8 2002?

9 DR. BRESSLER: It is still, unfortunately
10 for the cataract surgeons, around one or two
11 percent.

12 DR. WEISS: So, what rate would you like--

13 DR. EYDELMAN: Our unofficial revision
14 showed 1.5 percent.

15 DR. WEISS: If the unofficial revision is
16 1.5 percent, would everyone feel comfortable
17 leaving it at 1.5 percent for a clear lens
18 extraction?

19 DR. BRESSLER: As an acceptable risk? Is
20 that the question?

21 DR. STARK: You are talking about
22 cumulative or persistent?

23 DR. EYDELMAN: Well, 1.5 was for
24 cumulative at one year. You are absolutely right,
25 now we are talking about a three-year study.

1 Perhaps a persistent macular edema of 0.5 in this
2 grid--what should it be for clear lens extraction?
3 Or, we can ask what is the cumulative macular edema
4 over three years. They are two different
5 questions.

6 DR. WEISS: Dr. Stark?

7 DR. STARK: I would say persistent at 0.5
8 at the end of three years would be the maximally
9 acceptable rate.

10 DR. EYDELMAN: So, that high is
11 acceptable?

12 DR. STARK: It can be lower.

13 DR. WEISS: Dr. Mathers has pointed out it
14 is going to be that high so it would have to be
15 acceptable because basically it is the same
16 procedure and Dr. Grimmert is agreeing. Dr.
17 Bressler, and then I would like to move on from
18 that. Yes, Dr. Bressler?

19 DR. BRESSLER: My question is in reference
20 with what Dr. Rosenthal said, and that was, you
21 know, what are we going to accept? And, these are
22 individual events again. Is there any sort of
23 guide that is needed, required or recommended in
24 terms of if you add up all the adverse events that
25 could occur, because you have persistent edema,

1 plus retinal detachment, plus something or other?

2 DR. EYDELMAN: For IOLs we have not
3 designed studies like that. We have criteria like
4 that under LASIK studies but we have never done IOL
5 studies in such a way.

6 DR. BRESSLER: For a patient who otherwise
7 has normal vision except for their presbyopia, this
8 is more analogous to LASIK than to the IOL so I
9 would suggest you consider those.

10 DR. WEISS: I am in a hundred percent
11 agreement with Dr. Bressler. I think where we are
12 going to have to be moving is having a hybrid
13 between cataract IOL and refractive surgery because
14 really this is a medical procedure, whatever, that
15 has been done for people who have lost best
16 corrected vision but it is being done for
17 refractive purpose. So, I think we have to have
18 grids more similar to those we have for refractive
19 surgery patients.

20 DR. EYDELMAN: So, if I can challenge you
21 further then, can you recommend a cumulative
22 acceptable adverse event rate for a three-year
23 study?

24 DR. BRESSLER: What was it in your
25 refractive surgery ones?

1 DR. EYDELMAN: Those aren't three-year
2 studies.

3 DR. BRESSLER: What was it? One year?

4 DR. WEISS: One-year study.

5 DR. BRESSLER: Better people than I
6 thought about that for a long time--

7 DR. ROSENTHAL: Five percent--

8 DR. EYDELMAN: It was five percent but
9 that included microkeratome so it was a
10 combination.

11 DR. WEISS: So, we had a five percent
12 adverse event for one year in LASIK.

13 DR. ROSENTHAL: Correct.

14 DR. WEISS: So, would anyone be willing to
15 come up with what percent should be for visually
16 significant adverse events or what type of adverse
17 events would you suggest?

18 DR. BRESSLER: Well, it would be hybrid.
19 It would mainly be driven by things that affect
20 visual acuity.

21 DR. WEISS: Should there be a similar one
22 year for this?

23 DR. BRESSLER: Cumulative, yes, and that
24 seems a little high to me for this but I think that
25 is because we are talking about more visually

1 significant events than what you suggested from the
2 LASIK.

3 DR. ROSENTHAL: Correct.

4 DR. STARK: And also for refractive, Neil,
5 you can't have more than a certain vision loss, and
6 I can't remember what that is, but that should be
7 tied in with it. Vision-threatening complications
8 are what we want to get.

9 DR. WEISS: We don't have the refractive
10 table in front of us but I am hearing sentiment,
11 and I certainly have that sentiment, that this
12 study should be basically looked at in addition in
13 the same way that we looked at our refractive
14 surgery studies because this is a refractive
15 surgery indication, and Dr. Mathers seems to agree
16 with that. Do you need anything else from us on
17 this? Hyphema, did you need that from us? I think
18 that should be a fairly trivial rate. Do you want
19 to throw out a rate, Mike? Dr. Rosenthal?

20 DR. ROSENTHAL: You are talking about we
21 have to compare this, if I am not mistaking you, to
22 two guidances, one is the guidance related to the
23 surgical procedure; the other is the guidance
24 related to refractive surgical procedure. Is that
25 right?

1 DR. WEISS: I think that is what was being
2 suggested by Dr. Bressler, the reason being, as he
3 points out, these people are coming in with normal
4 best corrected and they want to know--

5 DR. ROSENTHAL: I understand.

6 DR. WEISS: --what their cumulative effect
7 is. If that is fine with the agency, we are going
8 to go to 5 C), do additional adverse events need to
9 be collected? If so, what should their acceptable
10 rates be? I think one additional one is just
11 looking at it cumulatively, looking at it another
12 way. Dr. Brown?

13 DR. BROWN: Loss of best corrected visual
14 acuity.

15 DR. WEISS: So, loss of best corrected
16 visual acuity.

17 DR. ROSENTHAL: That is part of refractive
18 surgical guidance.

19 DR. BROWN: Okay.

20 DR. WEISS: If there are any other ones on
21 the refractive surgical guidance that are not
22 coming to mind, I think those would have to be
23 considered by the agency as far as what would be
24 relevant to this. Dr. Brucker?

25 DR. BRUCKER: I assume that corneal

1 decompensation, penetrating keratoplasty are
2 automatically written in there.

3 DR. EYDELMAN: Yes.

4 DR. WEISS: Dr. Stark?

5 DR. STARK: One other thing, just to make
6 sure that once a patient is entered into the study
7 and they get to the operating room, if they have
8 surgery and then they don't get an intraocular
9 lens, that they are still continued in. So, there
10 are going to be some situations where the patient
11 doesn't get the implant after the incisions are
12 made so we are going to have to come up with what
13 is an acceptable rate of that too. Vitreous loss
14 for example, you don't want to lose that patient
15 from the study and say, well, that didn't happen;
16 that wasn't part of it.

17 DR. WEISS: Dr. Eydelman?

18 DR. EYDELMAN: Actually, that comes into
19 the definition of enrolled and once the surgical
20 procedure begins that patient is considered
21 enrolled and, therefore, any adverse events get
22 captured regardless of whether the device was
23 implanted or not.

24 DR. WEISS: Dr. Stark?

25 DR. STARK: You know, in the original IOL

1 studies we didn't have capsule rupture or vitreous
2 loss because we assumed there would be no lens
3 implants, and there were. So, you want to make
4 sure that if the capsule is ruptured or there are
5 surgical complications that these be recorded,
6 especially if the lens is implanted with a
7 vitrectomy. We would want to be able to capture
8 that information.

9 DR. EYDELMAN: That is actually all on the
10 current ISO forms.

11 DR. BROWN: Can I just add one item?

12 DR. WEISS: Dr. Brown?

13 DR. BROWN: This may be putting a
14 hypothesis out before we really have strong data
15 but one issue is in replacing the crystalline lens
16 in young patients who are going to have to have
17 this for many years, and does the lack of the
18 properties of the crystalline lens promote the
19 progression of retinal draws in patients who may
20 likely develop AMD later in life? So, you know, it
21 might be worthwhile in the post-marketing study to
22 have a fundus exam and five years may not be long
23 enough but it certainly would be worth at least
24 documenting the fundus appearance for long-term
25 adverse effect.

1 DR. ROSENTHAL: Is that accepted, Dr.
2 Brown?

3 DR. BROWN: No, that is what I am saying,
4 it is a hypothesis before we really have data for
5 that. It is just something to think about.

6 DR. WEISS: Question 6, FDA believes that
7 all multifocal IOLs' safety and efficacy profile
8 will have to be established in a cataractous
9 population prior to initiation of a clinical trial
10 in a non-cataractous population. Multifocal IOL
11 performance cataractous population will, therefore,
12 be known for all tests and sub-studies outlined in
13 ANSI draft standard for MIOLs. Which sub-studies
14 do you recommend for inclusion in the clear lens
15 extraction protocol for evaluation of performance
16 in this non-cataractous population?

17 One thing that I am going to ask--this is
18 sort of similar to the refractive surgery
19 population--I would like to know visual acuity
20 postop in terms of what percentage of people are
21 wearing glasses. I don't know if that would fit in
22 here or fit somewhere else but is that going to be
23 a criterion in these studies? Because if 40
24 percent or 50 percent are still wearing glasses,
25 obviously, it didn't have the impact that one would

1 hope.

2 DR. EYDELMAN: That would go under subject
3 survey. Under the study those are all the
4 evaluations done on all subjects.

5 DR. WEISS: I see.

6 DR. EYDELMAN: So, we are moving to the
7 sub-studies. That implies that the subject survey
8 would be repeated.

9 DR. WEISS: So, that would be under F),
10 "others" in terms of the--

11 DR. EYDELMAN: No, it would not be a
12 sub-study. It would be in the study.

13 DR. WEISS: It would be in the study as a
14 subject study. Dr. Brucker?

15 DR. BRUCKER: Can I ask two questions?
16 One, why do you make the assumption that you make
17 without having any data to back it up? Second, if
18 this study shows that there is no increased
19 complication rate, why can't multifocal IOLs be
20 judged on their own merit later on down the line
21 without having to be in cataractous patients?

22 DR. WEISS: What assumption are they
23 making, just for the first one?

24 DR. BRUCKER: If you can back up on the
25 right side? The FDA believes that all multifocal

1 safety and efficacy programs will be established in
2 cataractous patients. And, I am asking why are you
3 making the assumption--because it says "we believe
4 that..." and I am asking you if this trial now
5 shows that there is no difference and there are no
6 complication rates that are not predicted, etc.,
7 etc., etc. why should you do that?

8 DR. EYDELMAN: Generally, when we evaluate
9 a brand-new device we start out with placing it in
10 the population where the safety and risk benefit
11 are different. In other words, As we try to place
12 it in a subject that will benefit the most and have
13 the least risk.

14 DR. BRUCKER: So, if this trial--I am
15 playing devil's advocate--if this trial shows that
16 there is no increased risk and the patients are
17 benefiting, then anybody who submits an application
18 for an intraocular multifocal lens in the future
19 should be able to put it in either population.

20 DR. EYDELMAN: Well, we don't have a trial
21 yet so today we are discussing the status as of
22 today.

23 DR. BRUCKER: You put that slide up; I
24 didn't.

25 DR. WEISS: Dr. Rosenthal?

1 DR. ROSENTHAL: These are Class 3 devices
2 so that any time a new one comes on the market it
3 has to be studied. You can't find a substantial
4 equivalent to an existing IOL.

5 DR. BRUCKER: Right.

6 DR. ROSENTHAL: You have to study it.

7 DR. BRUCKER: Right, so I am saying--

8 DR. ROSENTHAL: And if you are going to
9 study it, I think the agency has taken the tack
10 that you should study it in a population that has
11 cataracts first because we have well-established
12 guidelines for what is required for an IOL to get
13 through the process. Now, if a company wants to
14 come here and study it in a non-cataractous
15 population, they are welcome to do so but we can't
16 allow them to put it on the market for both
17 populations until they have certainly studied it
18 for one, and actually because the indication is
19 totally separate. As you can tell, it has taken up
20 a day's worth of discussion on the issues related
21 to this one. We would not allow them to get the
22 second indication without a study. Have I made
23 that clear in my unclear way?

24 DR. BRUCKER: That is a different
25 explanation. It is an explanation of why it is

1 believed.

2 DR. WEISS: So, we are fine on that. We
3 are going to go on to Dr. Bradley and what I am
4 going to ask is, anyone who decides to answer this
5 one, if you can indicate whether you want any of
6 those sub-studies or any other sub-studies.

7 DR. BRADLEY: I think Dr. Brucker's
8 comment relates to the issue of the risk associated
9 with lens extraction surgery and is quite correct I
10 think. There would be no need to employ a
11 cataractous group. I think the issue at hand
12 though is with each novel, potentially multifocal
13 lens which can have its own specific risk and
14 efficacy problems, because of that unknown
15 presumably the FDA has chosen to employ a group for
16 which the risk/benefit ratio is different. It is
17 not the surgery.

18 DR. WEISS: Thank you, Arthur. Now, for
19 the second part of your answer, do you have any
20 comments on that, succinctly put?

21 DR. BRADLEY: Could you give me a minute?

22 DR. WEISS: I will give you a moment. Dr.
23 Brown and then Dr. Mathers.

24 DR. BROWN: For efficacy I would like to
25 see a reading speed under functional performance to

1 see that you have actually improved that.

2 DR. WEISS: Is there such a study that is
3 done in terms of reading speed?

4 DR. BROWN: There are validated tests that
5 use standardized text format, placement, lighting.

6 DR. WEISS: Dr. Rosenthal?

7 DR. ROSENTHAL: And the reason we are
8 asking this, as has been alluded to before, you are
9 taking patients with, hopefully, 20/20 vision clear
10 lenses and you are taking them out and putting in
11 multifocal lenses. Do you want to see is there a
12 drop in contrast sensitivity? I think obviously
13 fundus visualization we would include in all of
14 them just because it is good medicine. But, you
15 know, it is not taking the cataractous lens where
16 we don't require--well, we require sometimes these
17 sub-studies but you are taking someone who has a
18 clear lens or a peripheral cataract, or something,
19 and are there changes that occur that you want to
20 inform the patient about that may be of importance
21 to both them and to the doctor?

22 DR. WEISS: Dr. Brown, would you want to
23 exclude any of these? Would you want to include
24 all of them? I think most of us would say fundus
25 visualization. You need contrast sensitivity, I

1 would think. Your well-taken point of at least one
2 aspect of looking at functional performance.
3 Endothelial cell evaluation has come up before so I
4 think there would be agreement on that. For
5 defocus curves I would defer to everyone else on
6 the panel. Is there anything here that you
7 wouldn't want or anything in additional that you
8 would want? You would go along with that? Dr.
9 Mathers, then Dr. Ho, then Dr. Brucker.

10 DR. MATHERS: I would like to see glare
11 testing and I would also like to have recorded
12 symptoms of halos and symptoms of glare, not glare
13 testing.

14 DR. WEISS: So, I think we are going to
15 need a survey which has the subjective symptoms of
16 those phenomena that we know you can get with these
17 sort of IOLs, in addition to the refractive type
18 of questions that you would ask as far as what sort
19 of activities can you do without your glasses. Dr.
20 Ho?

21 DR. HO: Ralph, can you just explain a
22 little bit more? Are you saying that fundus
23 visualization is just perfunctorily put on any IOL
24 follow-up? You may not need to do a study. It is
25 harder to see the fundus through multifocal IOLs.

1 DR. ROSENTHAL: Well, we know that.

2 DR. HO: Okay.

3 DR. ROSENTHAL: But we have to know
4 whether it is so hard that if they do get a problem
5 in the back of the eye it won't be able to be dealt
6 with.

7 DR. WEISS: That is why we have retina
8 specialists. Dr. Maguire?

9 DR. MAGUIRE: I don't if anybody has given
10 any thought to this, but it is not just seeing in
11 the back of the eye; it is doing laser treatments
12 to the peripheral retina when they develop holes
13 and retinal detachments and everything else later
14 on, and also visualization. This is a real mixed
15 group here. I mean, we have an Array lens which
16 has degraded optics to get increased depth of
17 field. We have the newer lens that has a very
18 small diameter and you are going to have to try and
19 get your lens around that to get out in the
20 periphery. I don't know if it is possible or
21 whether it is within agency boundaries but I would
22 like to see some good studies on how laser energy
23 is delivered to the peripheral retina on these
24 different types of intraocular lenses because that
25 is a real public health issue too.

1 The other thing is for defocus curves in
2 lenses that suggest that they create some portion
3 of the presbyopic correction through accommodation,
4 I think a Hartman Schack analysis at a place like
5 Dr. Williams' place in Rochester, New York or
6 something like that to actually prove that they are
7 getting their effect from accommodation and not
8 from increased depth of field.

9 DR. WEISS: We don't really have to have
10 an improved mechanism; we just have to have
11 improved results.

12 MR. CALOGERO: Can I clarify a little bit
13 here? All this testing here would already have
14 been performed on, say, a multifocal lens in the
15 cataract population. The question is now you are
16 simply changing the population. You have a younger
17 population that didn't have a cataract. Is there
18 any expectation that the results in any of these
19 tests may be different simply because you are
20 putting it in this new population? We don't want
21 to repeat all these tests if they are not
22 necessary.

23 DR. WEISS: Dr. Maguire?

24 DR. MAGUIRE: Functional performance
25 certainly because you are taking patients with

1 cataract initially who already have decreased
2 optical function. Now you are taking people that
3 are normal and exposing them to lenses that
4 sometimes have degraded optical performance to
5 increase depth of field. Obviously, they may get a
6 different response than the cataractous group.

7 MR. CALOGERO: We have already had the
8 results from the functional test--

9 DR. WEISS: For the cataractous
10 population. I think Dr. Maguire knows that.

11 DR. MAGUIRE: But you are starting from a
12 different baseline.

13 DR. WEISS: I have heard the panel members
14 sort of agree that at least functional performance
15 should be repeated in this population. From what I
16 understood that Ralph just said, fundus
17 visualization is going to be repeated whether we
18 say it should or not. Is that correct? That is
19 going to be part of the protocol whether or not we
20 recommend it? Yes, you can elucidate.

21 DR. EYDELMAN: If I can just clarify
22 something, you mentioned about functional. You
23 wanted an addition of reading speed and that is a
24 separate issue and we all agree. But currently the
25 testing that is recommended under functional is

1 driving simulation. So, what we are asking is if
2 functional needs to be performed, then your
3 recommendation is that the company does a second
4 driving simulation to show the difference between
5 preop and postop in this new population. That is
6 specifically 6 A).

7 DR. WEISS: I personally would want that
8 because these people came with presumably excellent
9 best corrected visual acuity at distance preop and
10 if we found that their functional for the driving
11 simulation had decreased, that is something
12 patients would want to know. With the cataractous
13 population presumably it would improve. But here
14 the best corrected at distance may not improve; it
15 could get worse. Does anyone disagree with that?
16 Dr. Bradley?

17 DR. BRADLEY: I am not disagreeing.

18 DR. WEISS: Okay. So, I think we all
19 agree that functional performance, we want what is
20 already being performed to be repeated in this
21 population in addition to near vision functional
22 performance, which was suggested to be reading
23 speed.

24 DR. EYDELMAN: A second clarification,
25 glare testing is part of contrast sensitivity.

1 DR. WEISS: Then do people feel that
2 contrast sensitivity should get repeated in this
3 population? I see nods and I see nods fairly
4 uniformly so we want contrast sensitivity repeated
5 again in this population.

6 Defocus curves, do people want that
7 repeated in this population? I see definite no
8 responses on that one. So, we don't have a lot of
9 strong interest one way or another on defocus
10 curves.

11 Fundus visualization, do people want that
12 repeated in this population? One no and a
13 question. Dr. Grimmer?

14 DR. GRIMMETT: Was that helpful in the
15 original evaluation of some of these lenses in the
16 cataractous population? Did that help you one way
17 or the other?

18 DR. EYDELMAN: Well, we have only had one
19 MIOL approved so far, and what was required of that
20 MIOL is different than what is recommended
21 currently in the ANSI. We had a specific small
22 sub-study where they did more than just look but
23 there was a lot of discussion on the ANSI and that
24 is the current recommendation. Since this is now a
25 population after clear lens extraction that is

1 going to be around longer that might need laser
2 treatment, that might have RD, do we need something
3 more specific than a general questionnaire for this
4 population that will clarify visualization of the
5 retina? That is where this is going, or hoping to
6 go.

7 DR. WEISS: Dr. Ho?

8 DR. HO: There is no reason to believe
9 that there is a difference between the clear lens
10 group and the cataractous group, in my opinion. If
11 you want to get to the next level, as Leo suggests,
12 or maybe a couple of levels up in terms of doing
13 studies of energy and things like that, I think
14 that is a separate issue. I would argue those are
15 interesting studies. I think they would be
16 worthwhile studies but I am not sure that--as you
17 have described it, we know that it is more
18 difficult to see through them or to operate through
19 them or to laser through them.

20 DR. WEISS: What about the question about
21 vitreous adhesions in the younger population that
22 are going to be the subjects here? Do any of the
23 retina folks have concerns about that as far as
24 fundus visualization? I see no. Dr. Brown and
25 then Dr. Bradley.

1 DR. BROWN: In that original study did you
2 look at the peripheral retina? Was that part of
3 the fundus visualization or was it just macular?
4 Do you know?

5 DR. EYDELMAN: It was the whole retina.

6 DR. BROWN: And it was graded on some sort
7 of 1-4 kind of thing?

8 DR. EYDELMAN: I don't remember how much
9 of it was discussed in the open public hearing.

10 DR. WEISS: Dr. Bradley and then Dr.
11 Brucker.

12 DR. BRADLEY: Well, we finally go on to
13 the issue of effectiveness of these lenses after
14 talking about risk all day. I have several
15 comments on that. First off, we are all aware that
16 there are three ways you can provide near vision
17 for presbyopia, in this case a lens that is
18 inserted into the eye. One is that you can make
19 them a little bit myopic. One is that you can
20 aberrate the lens and give them increased depth of
21 focus. Finally, you can actually have a lens that
22 can change power, that is a truly accommodative
23 lens. All three have been used. I think at one
24 level, whatever study design is done, would be able
25 to discriminate between those three techniques and

1 that is very important.

2 The one we are specifically talking about
3 today is the multifocal because I think that is the
4 first batch of lenses that are going to come
5 through the FDA. The accommodative ones, we will
6 see plenty of those soon I think. These multifocal
7 lenses come with their own concern, that is, they
8 provide improved near vision at the cost of
9 degraded distance vision. So, it is essential that
10 distance vision be monitored very carefully with
11 these lenses.

12 It is very important to ensure that the
13 issue of pupil size is examined in this patient
14 population because in a highly aberrated eye the
15 aberrations will have more and more impact as the
16 pupil dilates. This, obviously, is particularly
17 true for these patients at night. Therefore, for
18 the issue of safety and visual function the most
19 important issue to monitor is night vision at
20 distance; is that compromised in these patients?
21 That is the most critical situation.

22 The question was do we measure glare
23 testing? That is one thought. Do we do night
24 vision driving? First off, glare testing is a very
25 poor technique for assessing night vision problems,

1 as you already know. You turn on the glare source,
2 the pupil constricts, etc., etc. So, that doesn't
3 work very well. Night vision driving simulations,
4 the average night vision driving simulator is a
5 very poor simulator of night vision. The reason
6 for it is that if it is entirely computer based,
7 the computer can generate about 100 to 1 range of
8 intensities. The entire reason that you have night
9 vision problems when you drive is that you are
10 talking about millions to 1 intensity range in the
11 environment, that is, dark road, very bright
12 headlights. The typical night vision driving
13 simulator cannot simulate that and that should be
14 known and built into any study design. Try and get
15 one that can accurately simulate the intensity
16 range that is going to exist at night. So, I am
17 very concerned about the large pupil, the night
18 vision problem at distance.

19 We move on to the issue of near vision.
20 How do you assess near vision? There really aren't
21 any standard ways that are particularly good, in my
22 opinion. I do like the idea of having a near
23 reading test. In the end, that is what the
24 patients want. They are all presbyopic, coming to
25 their clinician because they can't read anymore.

1 So, I like the idea--whoever presented it--of doing
2 a reading test. It is my personal experience, now
3 becoming a presbyope--that the particular near test
4 that is so critical is reading a low contrast text.
5 Any parents who have children who play video cards
6 will know all about this. It is 4-point type; it
7 is very low contrast; and you simply can't read it
8 unless you are well refracted at near. Likewise,
9 patients trying to read prescription bottles where
10 they have poor print.

11 Finally, I think the issue of near vision
12 can be evaluated in a survey with assessment of
13 spectacle use. I think a series of questions on
14 that topic will help. Again, spectacle use under
15 different circumstances--do you need your
16 spectacles in a restaurant at night, dim light,
17 trying to read the bill? That is when I need my
18 reading glasses.

19 So, be aware that there are ways to assess
20 near vision but they are not standard clinical
21 tests, and I think those should be employed. Thank
22 you.

23 DR. WEISS: Those are really excellent
24 comments, Arthur, and I think your sort of
25 directing these to what the issues with this

1 particular technology is going to be is a very,
2 very important additional to this. Dr. Brucker?

3 DR. BRUCKER: Just a question, have fundus
4 photographs ever been done as a sub-study?

5 DR. EYDELMAN: That was part of the
6 original sub-study for the first MIOL but it is no
7 longer recommended. So, if that is your
8 recommendation that would be something additional.

9 DR. BRUCKER: As long as it has been
10 done--

11 DR. EYDELMAN: Well, it was done for only
12 one IOL. It is not going to be done for other
13 MIOLs that are coming along.

14 DR. BRUCKER: That would be a mistake, but
15 if this IOL has been reviewed then it doesn't need
16 to be done.

17 DR. WEISS: Well, you can request that if
18 the IOL has not had this done that it should be
19 done. You could include that.

20 DR. BRUCKER: We have an aging population,
21 macular degeneration first and angiography laser
22 treatment. It ought to be known whether you can do
23 a photograph through one of these things.

24 DR. EYDELMAN: How many subjects do you
25 feel you would need to assess that?

1 DR. BRUCKER: Half a dozen.

2 DR. EYDELMAN: Originally we had a
3 sub-study of ten.

4 DR. BRESSLER: You mean five that had it
5 and five comparison?

6 DR. EYDELMAN: I think it was ten and ten.

7 DR. BRESSLER: That is fine.

8 DR. BRUCKER: That is fine.

9 DR. BRESSLER: You can tell very quickly I
10 think.

11 DR. WEISS: So, what I hear is that we
12 don't need fundus visualization because it has been
13 done already but it would be helpful to know
14 whether you can photograph these people. Dr.
15 Brown?

16 DR. BROWN: But I do think that as each
17 new technology comes out that that be replicated
18 for visualization also. For the periphery is what
19 I am particularly just curious about, whether they
20 are going to get to the edge of this lens? Does it
21 distort the view so much that you can't see?

22 DR. WEISS: Would you be satisfied though
23 with, let's say, ten eyes or ten patients as well?
24 So, it is a very, very small subset to look at the
25 periphery and do photos to see if that would be

1 impaired by the IOL? Does that seem satisfactory
2 to the retina folk among us?

3 Endothelial cell evaluation, is that
4 something that we want to repeat in this group if
5 it has been done in the cataractous population,
6 that is fine?

7 DR. BRUCKER: I would say that if the flow
8 of liquids, flow of aqueous and the dynamics in the
9 eye is not thought to be detrimental or changed by
10 the irregularity of the surface of the lens, then
11 you don't have to do endothelial cell counts. But
12 if you have a lens that shimmies and has a
13 particular configuration that the physicists think
14 may be causing current change in the eye, then you
15 should look at it because you may lose endothelial
16 cell count.

17 DR. EYDELMAN: I just want to clarify,
18 there are no endothelial cell sub-studies in the
19 regular MIOL. That was not on the list; that was
20 an additional criteria.

21 DR. WEISS: This one was not performed
22 before--

23 DR. EYDELMAN: Correct.

24 DR. WEISS: --so if you want it done, it
25 would have to be done in this population.

1 DR. EYDELMAN: Correct.

2 DR. WEISS: Dr. Grimmett?

3 DR. GRIMMETT: I would be in favor of an
4 endothelial cell sub-study even if the data exist
5 in the cataractous population. You are looking at
6 a different age range and you may have different
7 endothelial dynamics, endothelial cell layers more
8 robust in the young. You may find different things
9 depending on the age range that you look at. I
10 would be in favor of having an endothelial cell
11 sub-study.

12 DR. WEISS: We are going to have one more
13 comment by Dr. Smith. Then, if we are okay with
14 the agency, we will go on to the next. Dr. Smith?

15 DR. SMITH: I would just echo Dr.
16 Grimmett's comments and say it is very important to
17 add that.

18 DR. WEISS: I would want that done as well
19 in the post-market study.

20 DR. EYDELMAN: Wait a second, are you
21 saying you want it in the pre- and post-market
22 study? Because from what I understood in the
23 discussion before, the post-market is going to be
24 very large and it is going to be a yes or no.

25 DR. WEISS: Actually, I will withdraw what

1 I just said. Any other studies that we want aside
2 from the survey for which Dr. Bradley had mentioned
3 a bunch of things?

4 DR. STARK: Did we decide that vitreous
5 examination and documentation was too difficult to
6 do?

7 DR. WEISS: We decided that there would be
8 five or ten patients that would have periphery of
9 the retina as well as photographs done.

10 DR. STARK: I am talking about
11 documentation of the status of the vitreous and
12 vitreous--

13 DR. WEISS: I don't think that was going
14 to get done. Dr. Brucker?

15 DR. BRUCKER: I don't think it is very
16 practical. OCT would be great but only within
17 several millimeters of that surface, it is probably
18 not worthwhile.

19 DR. WEISS: So, that won't get done. If
20 agency is fine, we will go on to question 7. The
21 only current performance efficacy endpoint for
22 aphakic posterior chamber IOLs, FDA grid, is
23 postoperative best corrected vision of 20/40 or
24 better in 92.5 percent of the subjects. Is this
25 applicable to non-cataractous eyes undergoing clear

1 lens extraction for the correction of presbyopia?

2 Dr. McMahon?

3 DR. MCMAHON: No.

4 DR. BRESSLER: I agree.

5 DR. WEISS: Dr. Bressler agrees. So, I
6 assume you want higher criteria. Do you want from
7 us what the higher criteria are or is all you need
8 to know that that is not going to be sufficient for
9 this population?

10 DR. EYDELMAN: Well, you have decided to
11 have an inclusion criteria of 20/20 so it is up to
12 you whether you want to set an efficacy endpoint of
13 maintaining BC of 20/20 post surgery or not.

14 DR. STARK: Don't we have criteria already
15 for the refractory surgery protocols? It would
16 seem to me like you would keep those same criteria
17 and you would agree that a few may lose one or ten
18 letters, or whatever, but after a while we should
19 set a standard similar to the refractive surgery
20 protocol.

21 DR. WEISS: I would agree with that.

22 DR. EYDELMAN: The only criteria we have
23 in the refractive is for UCVA and predictability.
24 We don't have criteria for BCVA and that would be
25 okay.

1 DR. STARK: I thought we had loss of--

2 DR. WEISS: It is one or two lines--

3 DR. EYDELMAN: That is safety; that is not
4 for efficacy.

5 DR. WEISS: I see.

6 DR. EYDELMAN: It is an efficacy endpoint.

7 DR. WEISS: But what is the percentage for
8 the loss of two lines or more BCVA.

9 DR. ROSENTHAL: It is one percent.

10 DR. WEISS: One percent? Then we are
11 talking about 99 percent. If they were all
12 starting out 20/20, it would have been 20/30 or
13 better. Is that correct if you translate it over
14 to efficacy?

15 DR. EYDELMAN: If you want to keep it as
16 safety and not introduce efficacy in terms of BCVA,
17 that is fine. You don't have to create additional
18 criteria; you can stick with--

19 DR. BRADLEY: Let's keep it as safety.

20 DR. WEISS: Dr. Stark?

21 DR. STARK: If you look at it in efficacy
22 you have to take into consideration the
23 magnification of the myopes and the minification of
24 the hyperopes. But I think we should have it as an
25 efficacy issue also.

1 DR. WEISS: I think we also need a best
2 corrected visual acuity standard and the question
3 is what number do people want to come up with. You
4 know, this is being done for refractive reasons and
5 we wouldn't want too many people losing vision.
6 Dr. Bressler?

7 DR. BRESSLER: I just want to confirm what
8 people are agreeing to on the table. One, I do
9 think it should be done for safety because the
10 efficacy is going to be all the wonderful
11 suggestions that Dr. Bradley has brought up. I
12 just want to confirm that we are discussing that it
13 is going to be a change in letters of ten or more,
14 for example, because if you start at 20/12 as some
15 of these people may, then if they go below 20/20
16 that is an adverse event.

17 DR. EYDELMAN: Right. As far as safety,
18 we always talk about ten letters or two lines of
19 BCVA loss.

20 DR. WEISS: Does the panel want to have
21 efficacy including what your best corrected visual
22 acuity is or not in this case? No? That was a no?

23 DR. WEISS: Dr. Brucker?

24 DR. BRUCKER: So, you are willing to take
25 a 7.5 percent visual acuity loss of three lines--

1 DR. WEISS: No, I don't think anyone wants
2 to use that. That is not going to be applicable.
3 The question was is that applicable here and I
4 think the consensus of the panel was that it is not
5 applicable.

6 DR. BRADLEY: It is a safety issue, the
7 issue of best corrected visual acuity, and always
8 has been. Obviously this would be unacceptable for
9 safety--

10 DR. WEISS: We are saying it is no good;
11 we don't want it. We are just saying it has to do
12 with the safety; it is not efficacy. We are going
13 to be judging these efficacious in different modes.
14 That is satisfactory to the agency and we will go
15 on to B), are the predictability outcomes outlined
16 in FDA's draft guidance for refractive implants
17 applicable, 75 percent of eyes standard MRSE
18 plus/minus 1.0 diopter, 50 percent with MRSE
19 plus/minus 0.5 diopter and uncorrected vision, 85
20 percent with 20/40 or better. Is that applicable
21 here?

22 DR. WEISS: Dr. Bradley?

23 DR. BRADLEY: A suggestion to FDA to
24 perhaps update these data to the better of the new
25 lenses that you have seen. These old standards may

1 be too lax.

2 DR. WEISS: Dr. Eydelman?

3 DR. EYDELMAN: There aren't for lenses.
4 This is for refractive.

5 DR. WEISS: But I think we have to add to
6 that near vision criteria.

7 DR. EYDELMAN: That is C), 7 C).

8 DR. WEISS: Is this sufficient for IOLs
9 for distance and for refractive, plus/minus 1.0?
10 Did you want to say something?

11 MR. MCCARLEY: Well, the only comment is I
12 was going to ask you what are your guidelines for
13 cataract lenses on predictability and so forth? I
14 know this is more and this is the LASIK and phakic
15 lens guidelines. There aren't any for regular
16 IOLs.

17 DR. EYDELMAN: No, that is why I said the
18 only efficacy endpoint for IOLs is BCVA.

19 MR. MCCARLEY: Exactly, that is my point.

20 DR. EYDELMAN: That is the distinction I
21 was trying to make.

22 DR. WEISS: I think this also will have to
23 change if we are doing higher myopic levels than
24 what we are talking about because if these are
25 going to be used for beyond what the LASIK

1 guidelines are, you can't apply the same levels if
2 we are doing a very high myope. I don't think we
3 are just in terms of the criteria that are set
4 forth here. Walter?

5 DR. STARK: We need to add also
6 uncorrected visual acuity and whether or not there
7 is a drop in that. If we are taking plano patients
8 for presbyopia and they are 20/20 we need to look
9 at what percent of them are no longer 20/20
10 uncorrected afterwards.

11 DR. WEISS: Is that efficacy or safety?

12 DR. EYDELMAN: Change in UCVA would be
13 efficacy--

14 DR. STARK: It would be efficacy; they
15 could be corrected with glasses.

16 DR. EYDELMAN: BCVA would be safety and
17 UCVA is efficacy.

18 DR. ROSENTHAL: Excuse me, let me have
19 some idea of what the panel thinks should be the
20 percentage of patients who have uncorrected visual
21 acuity of something/something or better. If you
22 are taking 100 patients that are 20/25 and 20/20
23 and 20/15 what percent of those do you allow to
24 drop down to 20/40?

25 DR. EYDELMAN: Actually, it is the same

1 thing only a little bit twisted because you are
2 taking essentially patients, many of whom will be
3 UCVA 20/20 preop but the only postop criteria is
4 that UCVA of 20/40 is a success. We don't have any
5 UCVA of 20/20 as a success, as a set endpoint.
6 Ultimately you can have 75 percent of your subjects
7 20/20 UCVA preop and 85 with 20/40 but only 50
8 20/20 so the UCVA went down but it would still be
9 considered a success.

10 DR. WEISS: The thing is really what the
11 criteria for the final percentage that need to be
12 UCVA 20/20 is very dependent on who you are
13 entering into the study. If 100 percent of those
14 are emmetropes, then you might want a 95 percent
15 20/20--

16 DR. EYDELMAN: That is one question.

17 DR. WEISS: --if they are all minus 12 you
18 are not going to have the same expectation. So,
19 what we are going to tell you is going to be
20 totally dependent on whom you are entering into the
21 study. We could have them for different categories
22 and say, you know, between plus 2 to minus 2 we
23 have this expectation of UCVA; above minus 10 we
24 have this expectation of UCVA.

25 DR. ROSENTHAL: That is what we would

1 like.

2 DR. WEISS: Dr. Maguire?

3 DR. MAGUIRE: I pass.

4 DR. WEISS: You pass? So, you would like
5 from us somewhat of a grid, what we want the UCVA
6 of 20/20 percentage to be dependent on the entry
7 criteria of the patients?

8 DR. ROSENTHAL: Correct.

9 DR. BRESSLER: Adjusted for induced
10 magnification of course.

11 DR. EYDELMAN: That actually comes into
12 effect only at 15 diopters.

13 DR. WEISS: Does anyone want to give
14 us--Walter, do you have any guidance as far as what
15 you would want percentage UCVA's to be for various
16 groups?

17 DR. STARK: I would have to think about it
18 but it would depend on the starting point. You
19 know, it is a safety/efficacy issue, where they
20 started, but I would have to give it some thought.
21 We could develop that for you, recommendations.

22 DR. WEISS: If we are dealing with low
23 myopes, low hyperopes and emmetropes what would we
24 be saying--yes?

25 DR. EYDELMAN: I am just trying to think

1 of a typical subject. Theoretically, they are
2 going to have clear lens extraction because they
3 don't want to wear glasses. If they still need to
4 wear glasses for distance but don't need to wear
5 them for near, would that be a typical subject?
6 Even though it is correction of presbyopia, would
7 somebody who needs glasses for distance and near be
8 happy with wearing glasses only for distance but
9 not near?

10 DR. WEISS: Dr. Brucker?

11 DR. BRUCKER: I think that this is an
12 elective procedure for emmetropes or anybody with
13 refractive errors and if you turned around and took
14 a hyperope and made them a little bit more
15 hyperopic, even though they didn't need reading
16 glasses anymore, they would be really, really,
17 really unhappy. So, I think that this number of 85
18 percent with 20/40 vision would be unacceptable.

19 DR. WEISS: What would you like the number
20 to be?

21 DR. BRUCKER: Well, I think that you
22 should be having an uncorrected visual acuity
23 closer to the 20/20 and a percentage considerably
24 higher. It should be a more predictable way of
25 coming to a conclusion in these elective patients.

1 I don't do refractive surgery so I don't know what
2 is the realistic expectation but I would be pushing
3 90 and 95 percent coming within 20/20 vision.

4 DR. WEISS: Dr. McMahon?

5 DR. MCMAHON: I wrote exactly the same
6 thing and said 95 percent or greater equal to
7 20/25, 20/30 depending on the group entrance level.
8 I think you need to be in that range. I don't know
9 if it is realistic but--

10 DR. WEISS: So, we have Dr. Mathers, Dr.
11 Bressler, Dr. Maguire and then Dr. Bradley.

12 DR. MATHERS: I think 95 percent should
13 see 20/30 at least. That is certainly attainable.
14 That is reasonable.

15 DR. WEISS: While we are going around,
16 does anyone want to throw in their criteria for
17 near vision because this is being done for
18 presbyopes so if you are getting excellent
19 uncorrected distance acuity vision but your near
20 visual acuity isn't any good, then it sort of makes
21 the whole thing pointless but I will ask the other
22 people answering these questions to address that as
23 well. Dr. Bressler?

24 DR. BRESSLER: I wonder if there is some
25 way of turning it around, because of the example

1 you gave where the uncorrected visual acuity
2 doesn't drop more than ten letters, for example,
3 because it may be that someone is 20/20 with their
4 glasses and they just want to get rid of their
5 presbyopia, and they may be a success at near even
6 though their distance still requires their glasses.
7 I don't look at that as a problem, if that was 50
8 percent of the cohort, if they all solved what they
9 were trying to do, that is, get rid of their
10 presbyopia. If it is to correct both their
11 presbyopia and their distance visual acuity, that
12 is a different question and that is not what we are
13 dealing with. So, I would propose to see if there
14 is a way that it could be worded so that, again, it
15 is a ten letter or more loss from their distant
16 uncorrected visual acuity and their near
17 uncorrected visual acuity.

18 DR. WEISS: Dr. Eydelman?

19 DR. EYDELMAN: If you were doing surgery
20 for correction of near vision, having an efficacy
21 of a drop of ten letters of near vision--

22 DR. BRESSLER: I took it better for near.

23 DR. STARK: He meant a gain, I bet.

24 DR. ROSENTHAL: He meant uncorrected
25 distance and best corrected near.

1 DR. BRESSLER: That is correct.

2 DR. WEISS: Dr. Mathers?

3 DR. MATHERS: It is a little more
4 complicated because most of these people have a
5 little bit of monovision as well, and what they are
6 really interested in is a binocular distance vision
7 that is acceptable and a reading vision that is
8 acceptable. That is usually 20/25 distance and J3
9 binocular, but the individual eye doesn't really
10 matter to the patient. So, that is the reality of
11 what they are really trying to get at and we can
12 have relatively softer terms per eye as long as
13 they get there together.

14 DR. WEISS: Dr. Hilmantel, did you have a
15 comment? DR. HILMANTEL: Yes, you
16 may want to consider some kind of target like 90
17 percent or 95 percent getting both distance and
18 near of a certain level like 20/30, both
19 simultaneously.

20 DR. WEISS: I am in agreement with you
21 because the near hasn't been addressed and the near
22 is the only reason that they are having this done.
23 Dr. McMahon and then Dr. Bradley.

24 DR. MCMAHON: I would float a new target
25 of 75 percent greater than or equal to J3 and 50

1 percent greater or equal to either J1 or J2, I am
2 not sure which is the best there. I just think
3 establishing a level for J3 is not good enough.

4 DR. WEISS: Dr. Bradley?

5 DR. BRADLEY: It is worth considering that
6 unlike the refractive surgeries that we have been
7 looking at, the corneal ablative surgery, as you
8 approach zero correction you are ablating this
9 material, you introduce less error. In this
10 particular surgery the error doesn't approach zero
11 as the refractive error approaches zero. Add to
12 that that we are talking about multifocal lenses,
13 which are highly aberrated lenses, which must
14 degrade vision to some degree, and you have an
15 error for an emmetrope; you have a multifocal lens
16 for an emmetrope and it seems to me that the
17 emmetropic example that has been thrown around here
18 is that they are all likely to have a significant
19 decrease in their distance visual acuity and that
20 is just the reality of this particular procedure.

21 A second point relating to near vision, I
22 think that standard clinical tests, high contrast
23 acuity, are likely to underestimate the problems
24 experienced by patients at near, particularly with
25 multifocal lenses and that is why I suggested a

1 reading task, preferably a low contrast reading
2 task and preferably one in dim lighting would allow
3 you to evaluate the actual near vision problems
4 encountered by these patients.

5 DR. WEISS: I want to get back to the
6 efficacy criteria that we are trying to skirt about
7 here. We have a distance uncorrected visual acuity
8 and we have a near uncorrected visual acuity. The
9 distance uncorrected visual acuity, the numbers
10 that I have heard right now sort of thrown out are
11 90 percent, 95 percent in the 20/25 to 20/30 range.
12 I just want to know if there is some consensus on
13 that distance visual acuity. Dr. Bradley?

14 DR. BRADLEY: Not sure.

15 DR. WEISS: Can we come up with a number
16 for the agency as far as what we would consider
17 efficacy for distance uncorrected visual acuity?

18 DR. BRADLEY: I think 100 percent better
19 than 20/40.

20 DR. WEISS: A hundred percent better than
21 20/40. I personally would also like a higher
22 level--it could be a lower percentage but a higher
23 level of visual acuity and at least report the
24 percentage, whether it is 20/25 or 20/30, or
25 whatever. If 100 percent of people were 20/40 and

1 5 percent of people were 20/30 or better, I don't
2 think any of us would consider this procedure
3 efficacious. You are not that comfortable with it
4 at 90 percent, 95 percent, 20/25, 20/30?

5 DR. BRADLEY: I think I would defer to the
6 clinicians in the room dealing with patients. You
7 have a sense of what they demand. I mean, the
8 reason I think of 20/40 is that you need that to
9 drive, and to take somebody who sees perfectly well
10 with their spectacles and can drive, and then you
11 give them a procedure to improve their refractive
12 status and they can't drive is obviously a failure.
13 That is one criterion I can be comfortable with.

14 DR. WEISS: Bill, you had suggested the
15 20/25, 20/30, 90 percent, 95 percent. Are you
16 comfortable with that still?

17 DR. MATHERS: Yes, because I think that
18 for driving you usually use both eyes. It is too
19 stringent to say that 100 percent are going to be
20 this because if you are coming from a plus 6 you
21 might think your vision is a lot better even if
22 that particular eye didn't quite get to 20/40
23 uncorrected and you are still going to be better
24 off. So, 98 would be okay but I think 100 is too
25 much.

1 DR. BRADLEY: You say 100 is too much but
2 if you told the patients, by the way, 2/100 of your
3 patients are no longer going to be able to drive
4 after this procedure, nobody will have the
5 procedure.

6 DR. WEISS: The agency wants to comment.
7 After you comment I am going to ask you do you have
8 enough--I know you don't have an answer from us but
9 do you have enough information from us on this
10 particular one because we are running behind? Yes?

11 DR. BLUSTEIN: Yes, 20/40 is just for an
12 unrestricted driver's license. You can still drive
13 with worse than 20/40.

14 DR. WEISS: Malvina, do you have enough
15 information from us on this one? Enough
16 information being established, the additional
17 performance efficacy endpoints I think have already
18 been discussed in terms of low contrast reading and
19 maybe better driving function tests. If the agency
20 is fine with that, we will go on with number 8, how
21 do you recommend we evaluate patient's quality of
22 life issue? I think a survey was mentioned. Does
23 anyone have any additional ones? Dr. Eydelman?

24 DR. EYDELMAN: The question was specific
25 to whether you can recommend a specific patient

1 questionnaire, not just do a patient questionnaire
2 but can you go a step further and have any
3 recommendations as to which one is appropriate?

4 DR. WEISS: There are three types of
5 patient questionnaires on the screen, if anyone has
6 any preferences as far as any of these go. Dr.
7 Smith?

8 DR. SMITH: I am not going to express a
9 preference for any outcome those specific
10 questionnaires, however, I think it is important
11 that refractive surgical type questions be in the
12 questionnaire. All of those questionnaires don't
13 include those types of questions. I think also the
14 tasks that are being asked, some of them ask for
15 specific tasks that are more specific for older
16 individuals and the tasks that need to be asked
17 about should certainly include driving and things
18 that may be done by younger individuals.

19 DR. WEISS: And things that we have seen
20 come before us already such as what percentage can
21 read the newspaper without their glasses; what
22 percent can read a restaurant menu, etc. without
23 their glasses. Any other comments on this
24 particular question? Dr. Rosenthal?

25 DR. ROSENTHAL: The two latter

1 questionnaires were done mainly for distance
2 vision, and they were done early before near vision
3 was considered a refractive surgical procedure.
4 Does anyone have any information on near vision in
5 the refractive surgical environment?

6 DR. BRADLEY: Certainly the impression I
7 get from the silence around the table is that we
8 are not familiar enough with these surveys but,
9 clearly, you need to have questions that are going
10 to assess near vision. You must have questions
11 that are going to assess night vision and night
12 driving. These are the obvious problems that these
13 patients are going to experience. If these surveys
14 do not include such questions you need to add them.

15 DR. ROSENTHAL: The surveys include a lot
16 more about night driving and vision.

17 DR. WEISS: So, we need to add questions
18 about reading. Dr. Smith?

19 DR. SMITH: Those questions then need to
20 be validated. I mean, these are all validated
21 questionnaires for distance.

22 DR. WEISS: Dr. Bressler?

23 DR. BRESSLER: I don't know about the NEI
24 refractive but the NEI VFQ, visual function
25 questionnaire, does include several questions to

1 get a subscale for near activities and it has been
2 validated so that could perhaps be added to the
3 ones you are looking at here.

4 DR. WEISS: The other thing is it may
5 already include these but since the phenomena of
6 the halos, star bursts and such seem to be a major
7 side effect of these lenses, questions that address
8 those also have to be in these surveys if they are
9 not already. Dr. McMahon?

10 DR. MCMAHON: The one problem with using
11 the VFQ for this is even though those questions
12 exist, it was really designed for people who had
13 poor vision so you would have substantial ceiling
14 effects. That is where RQL actually was developed.

15 DR. WEISS: Well, I think you understand
16 the sentiment, that this has to be more refractive
17 surgery as opposed to diseased eye, and more set
18 towards the younger as opposed to elderly
19 individuals, with a lot of questions about visual
20 quality and near vision. If there are no other
21 comments on any--Dr. Bradley?

22 DR. BRADLEY: Finish your statement.

23 DR. WEISS: It was just if there are no
24 other comments. I guess there are.

25 DR. BRADLEY: It doesn't really fit into

1 your questions but one issue I think that the FDA
2 must address with these multifocal IOLs is how the
3 patient is going to provide informed consent. I
4 think this is not a trivial point with multifocal
5 IOLs. How does the patient say yes, I agree to
6 having multifocal optics when they have no idea
7 what multifocal optics is; they don't understand
8 the problems associated with multifocal vision?
9 You cannot describe it to a patient and I wondered
10 if the FDA had considered that. There are really
11 two possibilities out there. Certainly one has
12 been used. One is to provide the patient with
13 simulated vision. I think Alcon did that with
14 their Array lens. An alternative would be to have
15 a sort of non-invasive version of multifocal optics
16 provided to the patient, i.e., a contact lens. We
17 saw that in our previous FDA panel meeting. That
18 was for monovision. But, again, prior to the
19 surgery can you provide the patient with some way
20 so they can experience what multifocal optic vision
21 is going to be like and, therefore, can provide
22 informed consent? Because without the experience I
23 am not sure they can actually provide informed
24 consent.

25 DR. EYDELMAN: We actually tried to tackle

1 that problem and we recommended a couple of times
2 multifocal contact trial before surgery. The
3 problem is that not every MIOL design is paralleled
4 exactly by the multifocal contacts. So, even
5 though they will get a feel for what the
6 multifocality might feel like, it won't be the same
7 perception as when this is actually implanted. So,
8 it is not a perfect solution.

9 DR. WEISS: You know, Arthur, there are
10 things that we do to our patients every day that we
11 can't really give them a full idea about.

12 DR. BRADLEY: Yes, but I am just a bit
13 concerned. I think Dr. Maguire was alluding to
14 this earlier, that a lot of these patients are not
15 satisfied and want these lenses removed. I think
16 that could have been avoided if they could have
17 somehow seen what it was going to be like because
18 this is a compromised vision situation, very
19 clearly so.

20 DR. EYDELMAN: So, if your recommendation
21 is for each sponsor to try to identify a multifocal
22 contact lens which parallels the closest to their
23 design, and to give the patients a trial--

24 DR. BRADLEY: Maybe a subgroup or
25 something along those lines.

1 DR. EYDELMAN: Well, a subgroup won't
2 solve your problem.

3 DR. WEISS: You know, Arthur, personally I
4 think this is the problem you have in dealing with
5 refractive surgery patients, to try to take out
6 your bad candidates--which I assume the sponsor is
7 going to want to do--up front because they are not
8 going to want them filling out a survey saying they
9 are dissatisfied when they can predict they were
10 going to be dissatisfied no matter what happened.
11 I think it is very hard to show the increased
12 aberrations you have after LASIK. You can tell
13 people about the quality of vision issues but it is
14 hard to convey.

15 DR. BRADLEY: Yes, I agree and one last
16 comment on that is Dr. Lane, who presented this
17 morning, made a very clear statement. He said the
18 clinicians want to provide, and I am quoting, true
19 informed consent for this procedure. That is their
20 goal, and he was sponsored by the IOL company so,
21 clearly the IOL companies want this. The challenge
22 is how do you do it.

23 DR. WEISS: That will be the last comment
24 then. So, if the agency is fine with the answers
25 to these questions, in the remaining few minutes we

1 have a second open public hearing session if there
2 are any comments from industry. Mr. McCarley?

3 MR. MCCARLEY: I am just, again, sitting
4 here as an industry person, I am trying to look at
5 the companies that have a multifocal lens and want
6 to have an accommodative IOL but also all of the
7 others that simply have monofocal IOLs and I have
8 looked at the literature also--correct me if I am
9 wrong--most of the clear lens extractions up to now
10 have been done with monofocal IOLs. So, we are
11 looking forward. Why would we expect that to stop
12 if they have other potential problems with
13 multifocal lenses like potential degradation in
14 optics and other issues? Why wouldn't I expect for
15 a monofocal lens company to want to come in and try
16 to treat presbyopia? In fact, today's title is
17 clear lens extraction for the correction of
18 presbyopia. Well, the correction of presbyopia, I
19 believe, is done all the time, clear lens
20 extraction just with the monovision. So, have we
21 today addressed any of the issues for monofocal
22 lenses or was today a multifocal lens discussion
23 and an accommodative IOL discussion? Because that,
24 to me at least so far, hasn't been the majority of
25 clear lens extractions.

1 DR. WEISS: Dr. Eydelman?

2 DR. EYDELMAN: The goal of today was to
3 focus on multifocal and accommodative IOLs.

4 MR. MCCARLEY: So, would you then expect
5 to have a separate meeting with separate issues for
6 monofocal lenses that are currently available in
7 cataract surgery, treating presbyopia with
8 monofocal lenses?

9 DR. EYDELMAN: Only if we find that we
10 can't take the panel comments to the next step. In
11 other words, we are going to meet internally when
12 the situation arises and decide if we have the
13 answers. If we don't, we might call a meeting; if
14 we do, we will not.

15 MR. MCCARLEY: I would expect that
16 occasion to arise very quickly if you have some
17 companies wanting to do monofocal lenses. You
18 know, they are easier to do studies on compared to
19 multifocal lenses.

20 DR. WEISS: Does the agency have any other
21 comments? Do panel members have any other
22 comments? If not, I am going to ask Sally for
23 concluding comments.

24 DR. EYDELMAN: We just want to thank the
25 panel. It was a very clear and very concise

1 discussion. We appreciate it.

2 DR. WEISS: I don't think it was as clear
3 and concise as your presentation but thank you
4 anyway.

5 MS. THORNTON: I just want to, again,
6 thank the panel and echo Malvina's sentiments. It
7 has been a long day and I think we have gotten a
8 lot out of your hard work, and I appreciate your
9 time and attention to this issue. Thank you.

10 DR. WEISS: The open meeting is adjourned.

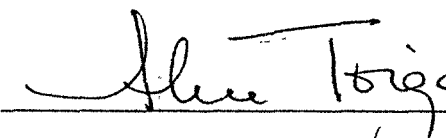

11 [Whereupon, at 3:52 p.m., the proceedings
12 were adjourned.]
